The Sanborn Library has been searched by EDR and maps covering the target property location as provided by PW Environmental were identified for the years listed below. The Sanborn Library is the largest, most complete collection of fire insurance maps. The collection includes maps from Sanborn, Bromley, Perris & Browne, Hopkins, Barlow, and others. Only Environmental Data Resources Inc. (EDR) is authorized to grant rights for commercial reproduction of maps by the Sanborn Library LLC, the copyright holder for the collection. Results can be authenticated by visiting www.edrnet.com/sanborn.

The Sanborn Library is continually enhanced with newly identified map archives. This report accesses all maps in the collection as of the day this report was generated.

Environmental Case Review

Dear Mr. McCarthy:

PW Environmental (PW) prepared this *Environmental Case Review* for the properties located at the future Santa Paula West Business Park. This report outlines historical work done at the properties and nearby properties by PW, along with information obtained while conducting this work. This report also contains a general file search conducted on the properties by Environmental Data Resources, along with PW's interpretation of the findings.

We trust this report addresses your current requirements. Please contact the undersigned should you have questions or comments regarding this report.

Respectfully submitted,

PW ENVIRONMENTAL

ENVIRONMENTAL HISTORY REVIEW SANTA PAULA WEST BUSINESS PARK SANTA PAULA, CALIFORNIA

EXECUTIVE SUMMARY

Areas described below are presented on Figures 1 through 4.

GENERAL PARCEL DESCRIPTIONS

The sites are bordered by West Telegraph Road to the north, the 126 to the south, Beckwith and Todd road to the east, and agricultural land to the west, in Santa Paula (Figure 1). They were formerly operated as agricultural land, with some storage areas for agricultural equipment and supplies, along with vehicular storage. A Railroad track splits the parcels in the center, running northeast/southwest.

Historically leaking aboveground storage tanks (AST) were previously located within Parcels #1 and #2 (Figure 2). PW was involved with the complete cleanup and site closure of diesel contaminated soil on Parcel #1. During the investigation on Parcel #1, it was determined that there was residual contamination left on Parcel #2 from a previous site excavation. The contamination on Parcel #2 was left in place.

Generally speaking, the search of Environmental Data Resources (EDR) records did not indicate any unknown recognized environmental conditions at the property.

RECOMMENDATIONS

The extent of residual contamination on Parcel #2 has not been delineated and is current unknown. At this time, it is anticipated that contamination is in the 15-25 feet below ground surface range. Geoprobe borings would need to be conducted in this area to delineate the residual contamination to determine if it would cause an issue during grading activities.

There is a possibility for residual contamination to be present at the northern edge of Parcel #5, from an uncompleted remedial excavation on the parcel to the north. Geoprobe borings would need to be conducted in this area to determine if residual contamination extended to this parcel.

All of the parcels have been used as agricultural land from as far back as 1938 (last aerial photograph), and most likely from much later. Shallow soils may contain residual legacy pesticides, such as DDT, Chlordane, and lead arsenate, to name a few. Surface grab samples would need to be conducted throughout the parcels to determine if there is residual lead, arsenic, or other pesticides from historical land uses.

The residence in the northwest corner of the Parcel #1 has been in place since sometime between 1947 and 1959, and may contain lead paint and/or asbestos.

It appears that power poles still exist on the property. Any old transformers located on-site may contain PCB oils, and areas around the transformer locations may contain PCBs.

General storage areas are in location on Parcel #2 and #4. It is unknown what was stored at the location. A visual check of the areas should be performed to see if there is any visual surface staining, which could indicate historical contamination from leaks or spills.

SITE HISTORY, PW INVOLVEMENT

Areas described below are presented on Figures 1 through 4. Copies of the reports listed below are available upon request.

Above Ground Storage Tanks

In December of 2005, PW removed one, 15,000-gallon Aboveground Storage Tank (AST) and one, 20,000-gallon AST. Following AST removal activities, two confirmation soil samples (AST-1 and AST-2) were collected and analyzed for total petroleum hydrocarbons as oil and diesel (TPH-O and TPH-D).

Evaluation of the laboratory analytical results for soil samples AST-1 and AST-2 indicated petroleum hydrocarbon contamination beneath the former AST locations. PW's *AST Removal Report*, dated January 9, 2006, summarized the AST removal activities.

To further evaluate the extent of hydrocarbon contamination associated with the former AST locations, PW advanced nine hand auger borings on January 5, 2006. The borings varied in depth from 5 feet bgs to 16 feet below ground surface (bgs). Hydrocarbon odors and staining were observed in collected soil samples. Groundwater was observed at 16 feet bgs.

Concentrations of TPH-D and TPH-O were reported in the majority of the analyzed soil samples. TPH-D and TPH-O were detected above the state Recommended Cleanup Levels (RCLs) in soil samples collected from borings HA1, HA2, HA3, HA4, HA5, HA7, and HA9. The results of this assessment are outlined in PW's *Hand Auger Assessment Report*, dated January 11, 2006.

Based on the findings in the *AST Removal Report* and PW's *Hand Auger Assessment Report*, PW commenced remedial excavation activities in January of 2006. Approximately 20,000 cubic yards of "clean" soil were excavated, along with approximately 6,000 cubic yards of contaminated soil.

As soil excavation progressed, evaluation of field and analytical data indicated that contaminant concentrations were decreasing from the center heading to the north and east. But as confirmation soil samples were collected further to the east, soil hydrocarbon concentrations began to increase, indicating an off-site source. An assessment was conducted along the eastern property line of Bannon Ranch to evaluate the potential for an off-site contaminant source. In February of 2006, nine borings were advanced between approximately 15 and 50 feet bgs (B1 through B9). Groundwater samples were collected from borings B1, B3, and B8. Indications of

hydrocarbon contamination in the soil were observed in borings B1, B4, B5, B7 and B8. Evaluation of field and laboratory analytical data suggested a source of diesel and oil contamination from the adjacent property, which appeared to be contributing to the contamination observed on the Bannon Ranch property. The results of this assessment were detailed in PW's *Property-Line Soil and Groundwater Assessment Report*, dated March 15, 2006.

The excavated contaminated soil was treated on site through a screener/shredder while a compost mixture was added. Three groundwater monitoring wells (MW1 through MW3) were installed in April 2006. The interpretation of the analytical data from these wells indicated that the groundwater was not impacted above the State MCLs. The results of this assessment were detailed in PW's *Remedial Excavation Report*, dated June 6, 2006, and *Groundwater Assessment*, dated February 23, 2007.

Underground Storage Tanks

PW removed one, 500-gallon steel Underground Storage Tank (UST) on December 14, 2005. The UST was located between the former location of the barns, near the center of the property. After the UST removal activities, four confirmation soil samples were collected. Sample results indicated that there were no major releases from the UST.

SITE HISTORY REVIEW, EDR

A review of EDR records did not indicate any recognized environmental conditions outside of what was previously known by PW. A copy of the EDR report is included as Appendix A.

DISCUSSION

The majority of contaminated soil was removed from under the former ASTs. Only minor contamination is present at depths of approximately 20 feet bgs, and should not pose an issue during grading of the site.

Although there are no recognized environmental conditions at the property, it has been used as agricultural land from as far back as 1938 (last aerial photograph). Shallow soils may contain residual legacy pesticides, such as DDT, Chlordane, and lead arsenate, to name a few.

The residence in the northwest corner of the property has been in place since sometime between 1947 and 1959, and may contain lead paint and/or asbestos.

It appears that power poles still exist on the property. Any old transformers located on-site may contain PCB oils, and areas around the transformer locations may contain PCBs.

**PARCEL #2
SANTA PAULA, CA
Former Bender Farms
AP#0980010165**

SITE HISTORY, PW INVOLVEMENT

Areas described below are presented on Figures 1 through 4. Copies of the reports listed below are available upon request.

Based on findings from the remedial excavation at Bannon Ranch (Parcel #1), it was apparent there was an offsite source of contamination mingling with the current contaminant plume. PW obtained historical topographic maps and aerial photographs from Environmental Data Resources, Inc. Review of the aerial photographs, indicated that ASTs have been in the specific and general location of the removed ASTs since at least 1929. At least one AST was present on the adjacent property to the east. Later aerial photographs showed the AST on the adjacent property to be approximately 5 to 10 feet east of the current property line.

After further research on the site, PW obtained a copy of the *Report on Excavation of Oil-Containing Soil at the Former Nomel Trust Ranch on Telegraph Road Santa Paula, California*, dated, August 13, 1999, generated by Holguin, Fahan, and Associates, Inc. (HFA). The HFA report summarizes the remedial excavation activities performed on the adjacent eastern property to remove "oil-containing soil beneath the location of a former aboveground storage tank". The oil was "used to fill smudge pots". Excavation activities were performed from July 16 through 21, 1999. The report states that the remedial excavation was 36 feet wide by 54 feet long by 20 feet deep. Approximately 1,053 cubic yards of soil was removed and spread on the property roads as base material. One soil sample was collected and submitted for laboratory analysis. The one soil sample was analyzed for benzene, toluene, ethylbenzene, and xylenes using EPA Method 8020. The laboratory analytical results indicated concentrations of ethylbenzene and xylenes at 0.015 and 0.059 mg/kg, respectively. Based on the soil sample Chain-of-Custody (COC), that was included in the report, the one soil sample was not analyzed for TPH-O or TPH-D.

An assessment was conducted along the eastern property line of Bannon Ranch to verify that contamination was removed during the remedial excavation conducted by HFA. The results of this assessment were detailed in PW's *Property-Line Soil and Groundwater Assessment Report*, dated March 15, 2006. Groundwater was first encountered in boring B1 approximately 24 feet bgs during drilling. No hydrocarbon odors or sheen were observed in the groundwater sample collected from B1 but a septic odor was apparent. In B8, saturated intervals were observed approximately 30 feet bgs and 37 feet bgs. These intervals were separated by a 3-foot thick, lean clay.

Four cross-sections were completed using soil analytical data from the property-line assessment and the remedial excavation. The cross-section locations are displayed on Figures 2. Cross-section A-A' (Figure 3) extends from B1 to B5 and show the approximate impacted soil contact projected through sandy and clayey intervals. Cross-section B-B' (Figure 4) extends along the

eastern property line from B2 through B7 (includes B1) and displays clayey soil with lenses of sand and gravel with corresponding hydrocarbon concentrations. Cross-section C-C' (Figure 5) extends from hand auger HA16 through boring B9. This cross-section extends from the southern edge of the remedial excavation to the south and displays the southern terminus of soil contamination. Figure 6 is a schematic drawing that displays the approximate location of the former AST in relation to the remedial excavation, boring B1, and the eastern property line. This figure also shows the location and hydrocarbon concentrations and depths of selected remedial excavation samples in respect to B1.

SITE HISTORY REVIEW, EDR

EDR did not report any findings for the property, including the AST removal and remedial excavation. This indicates the excavation work was not conducted under regulatory oversight, and was done solely at the discretion of the owner. A copy of the EDR report is included as Appendix A.

DISCUSSION

As of April of 2006, contamination remained in place on the property at approximate depths of 20 to 25 feet, near the western border in the location of the sloped area (Figure 3).

The parcel has been used as agricultural land from as far back as 1938 (last aerial photograph). Shallow soils may contain residual legacy pesticides, such as DDT, Chlordane, and lead arsenate, to name a few.

There is also what appears to be a storage area on the south side of the property, which was put in some time between 1994 and 2005. It is unknown what was stored at the location. A visual check of the area should be performed to see if there is any visual surface staining, which could indicate historical contamination from leaks or spills.

**PARCEL #3
SANTA PAULA, CA

SITE HISTORY, PW INVOLVEMENT

PW has had no historical involvement with this property.

SITE HISTORY REVIEW, EDR

A review of EDR records did not indicate any recognized environmental conditions at the property. A copy of the EDR report is included as Appendix A.

DISCUSSION

Areas described below are presented on Figures 1 through 4.

Although there are no recognized environmental conditions at the property, it has been used as agricultural land from as far back as 1938 (last aerial photograph). Shallow soils may contain residual legacy pesticides, such as DDT, Chlordane, and lead arsenate, to name a few.

It appears that power poles still exist on the property. Any old transformers located on-site may contain PCB oils, and areas around the transformer locations may contain PCBs.

**PARCEL #4
SANTA PAULA, CA
AP#0980010185**

SITE HISTORY, PW INVOLVEMENT

PW has had no historical involvement with this property.

SITE HISTORY REVIEW, EDR

A review of EDR records did not indicate any recognized environmental conditions at the property. A copy of the EDR report is included as Appendix A.

DISCUSSION

Areas described below are presented on Figures 1 through 4.

Although there are no recognized environmental conditions at the property, it has been used as agricultural land from as far back as 1938 (last aerial photograph). Shallow soils may contain residual legacy pesticides, such as DDT, Chlordane, and lead arsenate, to name a few.

There is also what appears to be a storage area on the western side of the property, which was put in some time between 2005 and 2009. It is unknown what was stored at the location. A visual check of the area should be performed to see if there is any visual surface staining, which could indicate historical contamination from leaks or spills.

It appears that power poles still exist on the property. Any old transformers located on-site may contain PCB oils, and areas around the transformer locations may contain PCBs.

**PARCEL #5
SANTA PAULA, CA
AP#0980020045**

SITE HISTORY, PW INVOLVEMENT

Although PW has had no historical involvement directly with this property, PW was involved with an Underground Storage Tank (UST) removal and remedial excavation directly across the train tracks to the north in 1987. The excavation was halted prior to the removal of all contaminated soil, and a subsequent assessment was not conducted to determine the extent of the soil contamination plume or if there were any impacts to groundwater. The case was closed with contamination in place.

SITE HISTORY REVIEW, EDR

A review of EDR records did not indicate any recognized environmental conditions at the property, but did include the former leaking UST case mentioned above at the parcel to the north. A copy of the EDR report is included as Appendix A.

DISCUSSION

Areas described below are presented on Figures 1 through 4.

Although there are no recognized environmental conditions at the property, it is unknown if the contamination to the north impacted soil and/or groundwater on the northern border of the property.

The parcel has been used as agricultural land from as far back as 1938 (last aerial photograph). Shallow soils may contain residual legacy pesticides, such as DDT, Chlordane, and lead arsenate, to name a few.

LIMITATIONS

This report, including all attached exhibits, describes results of all or a portion of PW Environmental's investigation into subsurface conditions at the subject site. The findings and recommendations are based on the application of a variety of scientific and technical disciplines to data developed regarding the subject property. The data was developed by observation, sampling, and gathering of information (both documentary and oral) about the property. Some of this data is subject to change over time. Some of this data is based on information not currently observable or measurable, but recorded by documents or orally reported by individuals. The findings and recommendations are based, in part, on application of sampling techniques. Said techniques inherently involve a risk of overstating or understating the presence or severity of contamination. The findings and recommendations are based also on sampling only for the specific contaminants shown in the laboratory reports. The samples taken were not subjected to testing for every contaminant known to the environmental industry, and every biological and/or chemical condition known to the environmental industry.

PW Environmental is not responsible for the accuracy of data not developed by PW Environmental or its agents or subcontractors. PW Environmental is not responsible for overstating or understating the presence or severity of contamination. PW Environmental is not responsible for failing to test for contaminants or biological/chemical conditions it had no reason to know were of concern at the subject site.

PW Environmental has performed this investigation in a professional manner using that degree of skill and care exercised for similar projects under similar conditions by reputable and competent environmental consultants. No warranty, either expressed or implied, was made. PW Environmental is not responsible for the ramifications caused by the concealment, withholding or failure to disclose of relevant information known to anyone contacted by PW Environmental in connection with its work at the subject site. This report and all field data, notes, laboratory test data on which it is based (hereinafter collectively designated "Information") were prepared by PW Environmental solely for the benefit of PW Environmental's client Meridian Consultants. Meridian Consultants has the legal right to release all or a portion of this Information, in its discretion, to third parties. Said third parties may not have access to all information upon which this report was based, nor access to prior reports, nor to other information developed and not placed in any report (hereinafter collectively designated "Additional Information"). The presence or absence of such Additional Information may materially affect the statement contained in this report. Any use or reliance upon this report of Information by a party other than Meridian Consultants, therefore, shall be solely at the risk of such third party and without legal recourse against PW Environmental, its employees, officers, or directors, regardless of whether the action in which recovery of damages is sought based upon contract, tort, statute or otherwise.

ADAMS BARRANCA HYDROLOGY STUDY

Introduction

The Santa Paula West Business Park is a planned commercial and industrial development containing a mixture of industrial, research and development, retail, office and commercial uses. The Specific Plan project site is located just outside the limits, but within the sphere of influence, of the City of Santa Paula. The land use is currently agricultural. The property is bounded by industrial development on the east, Adams Barranca on the west, Telegraph Road to the north, and Highway 126 to the south. Splitting the property east/west is the railroad operated by the Ventura County Transportation Commission Railroad (VCTC). The property ranges in elevation from approximately 250 to 222 feet above mean sea level and generally slopes from the north to the south. The Regional Location Map is shown below as Figure 1.

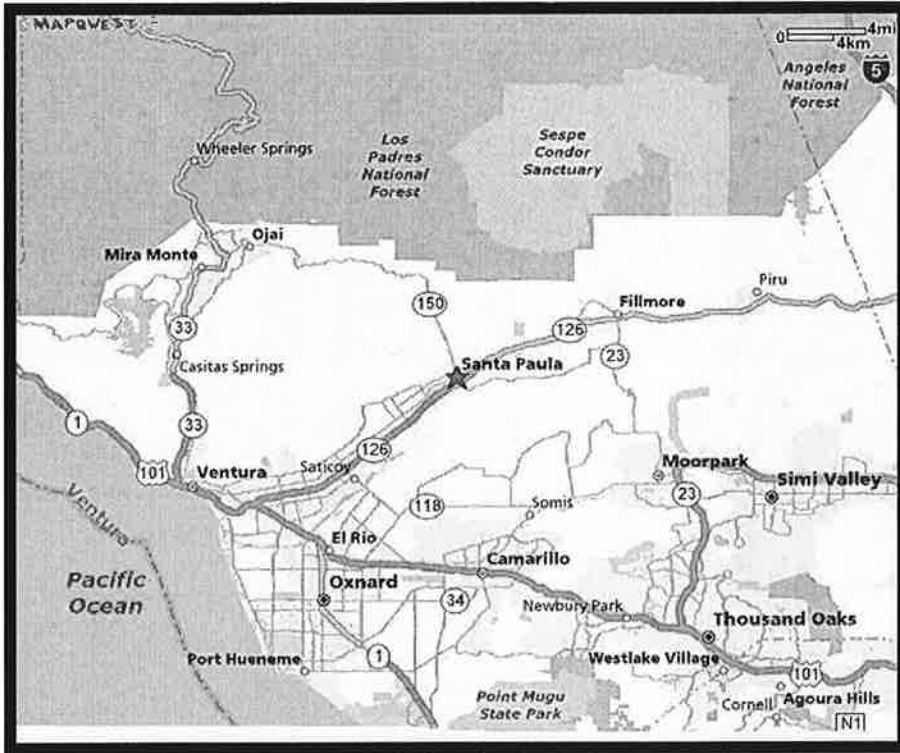

FIGURE 1 - REGIONAL LOCATION MAP

ADAMS BARRANCA HYDROLOGY STUDY

Purpose

The Santa Paula West Business Park Specific Plan encompasses approximately 58 acres of land in unincorporated Ventura County west of the City of Santa Paula. The proposed Specific Plan would permit the development of a variety of clean office, industrial and retail buildings ranging in size.

Access to the site is provided by Beckwith Road, Telegraph Road, and Faulkner Road. Secondary access is provided by Todd Lane (a private road). Figure 2 shows the project location. This study provides an evaluation of the existing drainage condition within and adjacent to Adams Barranca. Existing site conditions show that the proposed project is located within a Floodplain Zone A. A CLOMR will be filed with the development of this proposed project to redefine the flood zone limits using the flows determined by this supporting hydrology study. This primary reason for this report is to have an agreement between the affected agencies (FEMA, City of Santa Paula, and County of Ventura) on existing conditions within Adams Barranca.

FIGURE 2 – PROJECT LOCATION MAP

ADAMS BARRANCA HYDROLOGY STUDY

Existing Drainage Area Descriptions

Adams Barranca watershed is tributary to the Santa Clara River in Ventura County and is approximately 8.8 square miles. Adams Canyon flows in a north south direction for approximately seven miles before it's confluence with the Santa Clara River. The 2005 Lidar topography provided by the County of Ventura on NAVD 1988 vertical datum shows the watershed as generally steep canyon areas, with the downstream two miles extending from Foothill Road to the Santa Clara River being flat agricultural area.

Adams Canyon is currently undeveloped. The land use in the watershed is mostly classified as herbaceous, scrub and brush rangeland, with some cropland, pasture and orchards. The watershed has high debris production potential and there is an existing debris basin just upstream of the Foothill Road Crossing. The debris basin has not been considered in this report for any storm attenuation. The soils types are mostly classified as Ventura Soil Type 1, equating to NRCS hydrologic soil group D described as "clay loam, silty clay loam, sandy clay, silty clay or clay." (NRCS, 2007) The remaining watershed is mainly classified as Ventura Soils Types 2 and 3, equating to NRCS hydrologic soil group C: "Hydrologic group C soils are sandy clay loam" (NRCS, 2007). Refer to **Exhibit 2** for soils types.

Hydrology Methodology

The existing hydrology conditions of the Adams Canyon Watershed were determined according to the Ventura County Watershed Protection District Hydrology Manual, the County's Time of Concentration Calculator and Rational Method Design Program, VCRat 2.6 and VCRat 2.2.

The watershed was subdivided into approximately 98 subareas ranging from 5.5 to 108 acres subareas using Lidar topography. Ventura County standards prefer a range of 40-80 acre watersheds, which 84% of the subareas are, but allows for an absolute maximum subarea of 120 acres. Then each of these were broken down into an overland flowpath and a channel flowpath to calculate the Time of Concentration. A Time of Concentration was determined for 25% of the subareas (Appendix D), and the parameters are listed below:

- Rainfall Zone K
- Flood Zone 2
- 100 – year storm frequency
- Undeveloped

ADAMS BARRANCA HYDROLOGY STUDY

- 100% impervious for all subareas
- Weighted soil average calculated in GIS from Ventura County soils information.

Once the Time of Concentration was determined for 25% of the subareas, we analyzed the remaining subareas based on engineering judgment for similar traits and assigned those subareas times of concentration based on the calculated subareas. The VCRat 2.6 program was then used to calculate the 100-year peak flow rate and volume for the entire watershed area. Runoff hydrographs are computed within the model for each subarea, routed through a conveyance system and combined with other subarea hydrographs as the analysis proceeds downstream through the watershed. The additional VcRat 2.6 Parameters are listed below:

- Routing Type was mountain channel if slope is >5%. Natural Valley if slope <5%
- Routing Length used Lidar and best judgment
- Routing slope used Lidar Topography.

Once a VCRat file was complete, an aerial reduction factor was calculated for the overall watershed and each confluence point that has a contributing area greater than 640 acres. Ventura County allows for an aerial reduction, which is a factor that accounts for the varying intensities over watersheds greater than 640 acres. An aerial reduction factor is computed by taking the VCRat 2.6 output file and using VCRat 2.2 to calculate the revised flow rates, see **Appendix G** for the program output. Each confluence point has a different aerial reduction factor due to the difference in contributing drainage areas.

Table 1 – Aerial Reduction Factors

Node	Acres	Aerial Reduction Factor
14	951	0.924
48	961	0.923
60	3116	0.854
114	5580	0.794
116	5580	0.791

ADAMS BARRANCA HYDROLOGY STUDY

A fattening factor was used to adjust the volumes calculated by VCRAT to be more accurate based on the watershed location. The composite soil type for each basin was converted to the corresponding NRCS hydrologic soil group (Group C) and appropriate curve numbers were calculated on the basis of land use, vegetation type, and soil condition per Exhibit 14A in the Ventura County Hydrology Manual. Supplemental information provided in a report completed by PACE Engineering shows the composite curve numbers for each Node (**Appendix I**), which was used for the generation of the Curve Numbers below. The weighted average 100-year 24-hour rainfall value was calculated using GIS and this was used to calculate the fattening factor used in the VcRAT 2.6 program.

Table 2 – Fattening Factors

Node	SCS CN	Rainfall Contour (in)

ADAMS BARRANCA HYDROLOGY STUDY

Table 4 – Adams Canyon Existing Structure Capacities

	Type of Undercrossing	Approximate Capacity (cfs)
Telegraph Road	10' H x 24' W RCB	3,200
Railroad Crossing	8' H x 28' W Crossing	2,400
Highway 126	Double 12' H x 10' W	2,200

Adams Barranca Summary

Santa Paula West Business Park does not discharge water to Adams Barranca along the west boundary of the project. The amount of water that is within the creek and overtops the creek banks is due to insufficient capacity at existing crossings along the channel. Along with the proposed development, the creek is proposed to be altered to contain the existing flows and route floodwaters away from the proposed structures to remove the future development from the current Flood Zone 'A' per FIRM Panels 778 and 779 of 1275 (**Appendix E**). The primary reason for this report is to have an agreement between the affected agencies (FEMA, City of Santa Paula, and County of Ventura) on existing conditions. Once the existing flow rate conditions are agreed upon, we can move forward with a proposed design condition that will benefit the property. Santa Paula West Business Park will file a CLOMR and a LOMR to adjust the current FIRM Maps with the County using the adjusted flow rates and the proposed design along the eastern boundary of the project.

SANTA PAULA WEST BUSINESS PARK PRELIMINARY DRAINAGE REPORT

Introduction

The Santa Paula West project is a planned commercial and industrial development containing a mixture of industrial, research and development, retail, office and commercial uses. The Specific Plan project site is located just outside the limits, but within the sphere of influence, of the City of Santa Paula. The land use is currently agricultural. The property is bounded by industrial development on the east, Adams Barranca on the west, Telegraph Road to the north, and Highway 126 to the south. Splitting the property east/west is the railroad operated by the Ventura County Transportation Commission Railroad (VCTC). The property ranges in elevation from approximately 250 to 222 feet above mean sea level and generally slopes from the north to the south. The Regional Location Map is shown below as Figure 1.

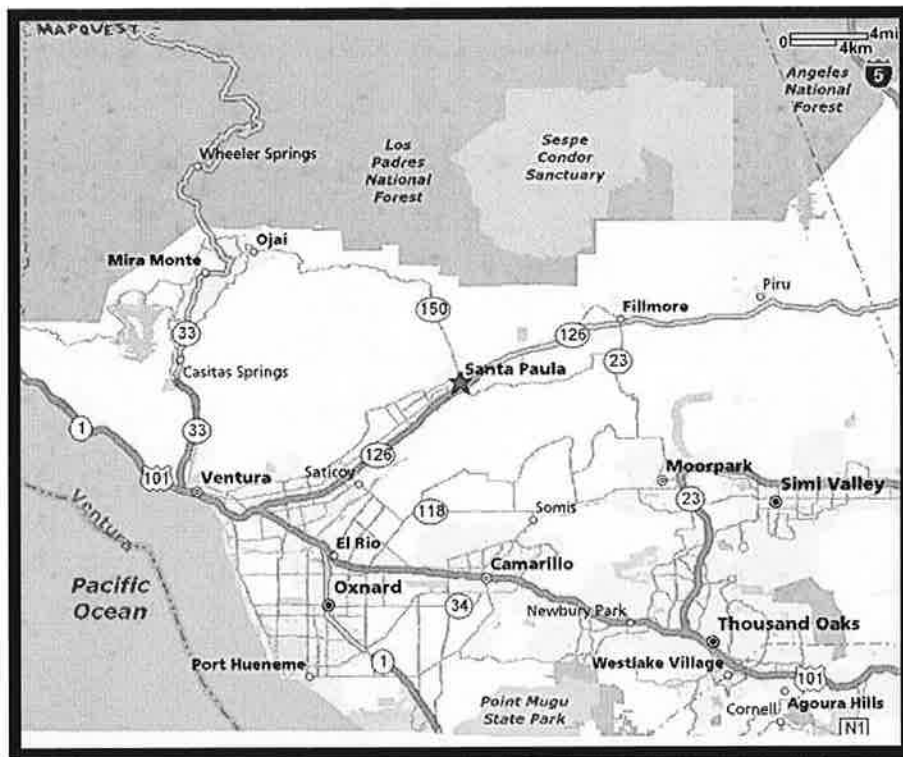

FIGURE 1 - REGIONAL LOCATION MAP

Project Description

The Santa Paula West Business Park Specific Plan encompasses approximately 58 acres of land in unincorporated Ventura County west of the City of Santa Paula. The proposed Specific Plan would permit the development of a variety of clean office, industrial and retail buildings ranging in size.

Access to the site is provided by Beckwith Road, Telegraph Road, and Faulkner Road. Secondary access is provided by Todd Lane (a private road). Figure 2 shows the project location.

FIGURE 2 – PROJECT LOCATION MAP

Purpose

This study provides an evaluation of the existing drainage conditions and the design of a preliminary storm drain system within the Santa Paula West Business Park Specific Plan project. The general approach of the proposed condition is to maintain the existing drainage pattern without having adverse affects offsite.

Existing site conditions show that the project site is located in a floodplain, Zone A. Based on our analysis of Adams Canyon Barranca using flows generated by an Existing Condition study by Jensen Design & Survey currently being reviewed by the County of Ventura Watershed Protection District, the floodplain limits currently shown by FEMA are inaccurate. This report will summarize the flow information used in Adams Barranca for a HEC-RAS analysis and a CLOMR/LOMR will be filed at a later date to modify the current FIRM maps.

Future site runoff will be conveyed through the project via surface drainage and underground structures connecting into Adams Canyon Barranca and the existing culverts under Highway 126. This report includes hydrologic analysis and supporting calculations to demonstrate how the project's contributions to stormwater runoff resulting from development will be controlled and match existing conditions at major outlet points.

Hydrology Methodology

The existing conditions of the Santa Paula West Business Park Specific Plan were determined according to the Ventura County Watershed Protection District 2006 Hydrology Manual, the City of Santa Paula Master Plan for Drainage, the County's Time of Concentration Calculator, and Hec-Ras.

- Soil Group Types 3 & 4 are used for drainage areas in this study
- Existing condition coefficients were obtained from Appendix A, Exhibit 6A of the 'VCWPD Hydrology Manual'.
- Proposed condition coefficients were obtained from Appendix A, Exhibit 6A of the 'VCWPD Hydrology Manual'.
- Time of Concentration (Tc) values were calculated with the Tc Calculator program for each drainage area.

- Water quality treatment will either be flow based, volume based, or a combination of the two according to current SQUIMP guidelines at the time of Tentative Map submittal. Appendix D, Exhibit B shows various areas used for treatment, infiltration, and detention that will meet or exceed the County's SQUIMP requirements according to the Ventura County Technical Manual.

Existing Drainage Conditions

The Santa Paula West Business Park site is located within the greater Santa Clara River watershed. The onsite drainage is a tributary to the Santa Clara River, and has been divided into four drainage areas: Adams Canyon Barranca (Area A), Todd Lane Drain (Area D), Highway 126 West culverts (Area B), and Highway 126 east culverts (Area C). The limits of the drainage subareas were determined by a flown aerial topo (NGVD 1929 datum) and a site visit. In performing the hydrology analysis for the existing condition, all of the drainage areas within the property limits were analyzed for a ten through a hundred year storm events. The subarea properties and the calculated runoff are shown in **Table 1 and in Appendix A**.

The 58 acre project site is currently used for agriculture and varies in land gradient sloping north to south with the railroad and the Highway being higher than adjacent grade and acting as dams. The railroad has two culverts (2-12" CMP and 1-24" CMP) to transport the onsite water from the north to the south, not including the crossing for Adams Barranca. These culverts are about 50% blocked with sediment and currently do not function at capacity. There are also four existing culverts of various sizes under Highway 126 that are blocked with sediment and do not function at capacity, causing ponding north of the Highway during storm events. The outlets of the culverts are on the south side of Highway 126 and drain through historic agricultural drainage channels ending in the Santa Clara River and do not connect to Adams Barranca.

A small portion of the property drains west into Adams Barranca (**Area A on Exhibit A**). Adams Barranca is a raised channel with the top of the channel being an average 2.0' higher than the adjacent grade on the property. This property is subject to flooding during a 100 year storm event from Adams Barranca, according to the current FIRM maps (Map Numbers 06111C0778E and 06111C0779E – **Appendix E**). A HEC-RAS analysis was completed using flow information from a VcRAT analysis completed by Jensen Design & Survey to support a change in the floodplain limits. A more detailed analysis will be completed at the Tentative Map level of review and will be coordinated with the County and City. The existing condition report for the

SANTA PAULA WEST BUSINESS PARK PRELIMINARY DRAINAGE REPORT

flow rates used in the HEC-RAS analysis is currently being reviewed by the County Watershed Protection District.

The Highway 126 westerly culverts (1-24” CMP, and 1-48”x24” Arch CMP), drainage area B, handle the flows from approximately 27 acres. Overflow from pipe inlet blockage travels easterly to two other culverts under Highway 126 or farther east to the inlet at the end of Faulkner Road into a 72” RCP leading to Todd Lane Drain.

The Highway 126 easterly culverts (2-52”x30” Arch CMP), drainage areas C and D, handle the flows from approximately 31 acres. Overflow from pipe inlet blockage travels easterly to the inlet at the end of Faulkner Road into a 72” RCP leading to Todd Lane Drain.

The time of concentration for each overall drainage area within the property boundaries was calculated using VcRAT Time of Concentration calculator from Ventura County to obtain a time of concentration and a peak flow rate. That peak flow rate was used to calculate a cfs/acre which was then applied to each drainage subarea, respectively as shown in **Appendix A**.

The Santa Paula Master Storm Drain Plan shows 75% of the specific plan area to be draining to Todd Lane Drain. Todd Lane Drain has a maximum design capacity of 393 cfs in a 100 year storm. After an analysis of the onsite drainage patterns, Todd Lane Drain receives flows from the project site only in the event of blockage at the Highway 126 culverts.

The existing flow areas and peak flows for the existing condition are shown in Appendix A and Table 1.

Table 1 – Santa Paula West Business Park Specific Plan Existing Runoffs

Watershed	Subarea	Area (ac.)	10-year	50-year	100-year
			Q10 (cfs)	Q50 (cfs)	Q100 (cfs)

	C1c	0.9	0.4	1.2	1.6
	C2	7.6	3.6	10.3	13.5
	D	7.3	7.9	14.0	19.6
	TOTAL	30.5	18.8	45.5	61.0

Proposed Drainage Conditions

The proposed grading and drainage (see **Appendix D, Exhibit B**) shows the site maintaining the north to south flow pattern. The northern part of the project has a steeper slope of 3%, while the south end of the project slopes an average of 1%. The site will be mostly fill in order to raise the buildings above any flooding potential. Various catch basin locations and a local storm drain system, designed to current City of Santa Paula Standards will convey the stormwater to five different outlet points, as shown on **Exhibit B**. The storm drain system is a network of local storm drain pipes routed within the project site and flows by gravity. A parallel channel and a debris basin are incorporated into plans to improve the Adams Barranca, and that is further explained later in this report, but no onsite stormwater will be directed to Adams Barranca.

The project will take advantage of planter areas throughout to allow for infiltration and treatment of rain water to comply with the County of Ventura MS4 permit. Before the stormwater leaves the site it will be detained in small localized landscaped basins and three larger basins onsite to allow for infiltration and peak flow control per current MS4 standards at the time of Tentative Map submittal. Storm drain sizes and slopes will be determined once site layout is finalized at the Tentative Map level.

The five outlet points for site water discharge are Todd Lane Drain (Pipe 9), three existing culvert locations under Highway 126 (pipes 2,5,8). Proposed condition stormwater discharge at each outlet point will not increase from the existing peak outflow (**Appendix C**), due to the implementation of detention basins. Preliminary calculations have been done to size the proposed detention basins, however a more detailed analysis will be required at the Tentative Map level, once the site layout is completed. There are two surface detention basins located on site and one subsurface detention basin located on the east end of the development (see **Appendix D, Exhibit B**).

Most of the existing condition drainage issues onsite are due to sediment build up in the existing storm drain pipes under Highway 126. By developing the site, undergrounding existing open inlet pipes at Highway 126, and providing a system for treatment and flow control, the site will not be exposed to sediment and the usual culvert blockage that can cause ponding north of Highway 126 will be eliminated.

SANTA PAULA WEST BUSINESS PARK PRELIMINARY DRAINAGE REPORT

The time of concentration for each overall drainage area within the property boundaries was calculated using VcRAT Time of Concentration calculator from Ventura County to obtain a time of concentration and a peak flow rate for the developed condition. The peak flow rate was used to calculate a cfs/acre, which was then applied to each drainage subarea, respectively as shown in Appendix C and Table 2.

Table 2A – Santa Paula West Business Park Specific Plan Proposed Runoffs

Water Quality

Water quality measures for the Santa Paula West Business Park development will consist of Best Management Practices (BMPs) that are listed in the Ventura County Stormwater Quality Urban Impact Mitigation Plan (SQUIMP). This plan was devised to address storm water pollution for any new development and redevelopment. Stormwater treatment occurs onsite and prior to stormwater leaving the site to existing drainage facilities. Water quality treatment will either be flow based, volume based, or a combination of the two according to SQUIMP guidelines. The following are some of the BMPs that may be utilized on the project.

Bio-swales will be designed into various parking landscape areas to convey and treat paved areas and allow stormwater capture for infiltration and evapotranspiration. These swales that generally have low velocities are used to mitigate concentration of nutrients by its contact with vegetation. Bio-swales could occur within each planter area designed within the project, providing cleansing of storm runoff prior to discharge into Adams Barranca and Santa Clara River.

Bio-filter inserts will be used in curb inlets to capture oil and grease, suspended solids, metals, gasoline, pesticides and pathogens. Also, storm drain inlets and catch basins will have proper signage and stenciling to discourage illegal dumping. Filters and signage will be checked and/or replaced annually.

Two surface detention basins are located onsite north of the railroad at the center of the development and north of the highway at the center of the development in addition to one underground basin located east of Beckwith Drive just north of the highway. Localized detention basins will also be used throughout the site, such as landscape areas that are used to lag the discharge of stormwater. These areas will settle out and filter pollutants that are within the runoff on-site. The final sizing of the detention basins and landscape areas will be provided with the Tentative Map design.

The following table shows the volume required for each drainage area according to the SQUIMP guidelines and the Tentative Stormwater Permit for Ventura County as of the date of this report for water quality treatment. The Railroad Right of Way area is not included in the treatment volume requirements.

Table 3 – Santa Paula West Business Park Specific Plan Water Quality

Subarea	Drainage Area (acres)	Railroad Right of Way Area (acres)	Total Required Treatment Area (acres)	Volume Based Water Quality Required (ft ³)**
A	1.7	0.09	0.00	0.0

			Total Volume	149946.7

** Calculated using a 75% impervious area average. Used method in SQUIMP manual page 5-5 for calculations

(same value as a 0.75 in storm event as stated in new permit)

Adams Canyon Barranca Floodplain Analysis

Current FIRM maps dated January 20, 2010 show the westerly portion of the property within flood Zone A (See **Appendix E**). After a review of historic flooding, existing contours, and site features, the Flood Zone limits shown on the current FIRM maps are inaccurate. Using flows generated by a VcRAT study completed by Jensen Design & Survey currently under review by the County of Ventura Watershed Protection District, a preliminary HEC-RAS River study of Adams Canyon Barranca was completed.

Adams Canyon Barranca’s current banks are earthen dikes created by past farm land owners in order to prevent flooding their crops. These dikes are about 2.0 feet above adjacent grade on both the east and west sides of the channel. The Adams Barranca and the undercrossings at Highway 126, the Railroad, and Telegraph road are undersized for the 4,810 cfs flow.

Table 4 – Adams Barranca Existing Structures

	Type of Undercrossing	Approximate Capacity (cfs)
Telegraph Road	10’ H x 24’ W RCB	3,200
Railroad Crossing	8’ H x 28’ W Crossing	2,400
Highway 126	Double 12’ H x 10’ W	2,200

Multiple HEC-RAS analysis were completed to develop our findings. A summary of the HEC-RAS plans and geometry files are in the **Appendix F**. The existing condition where the channel geometry is overtopped was modeled using lateral structures as weirs at the top of the existing bank to analyze the flow that has left the channel. Existing condition topography reflects that if water overtops the channel, it will leave the channel forever and head either east or west to Todd Barranca or Clow Road undercrossing, respectively. The flow rates that overtopped the bank on the west side of the Adams Barranca were removed from the total design Q for the proposed condition analysis at each respective cross section. The summary of the flow rates that have overtopped the existing banks at certain locations is shown below and in **Appendix F**.

Table 5 – Adams Barranca Existing Overflow Values

Main Channel Station	Overtop Flow West (ROB) (cfs)	Overtop Flow East (LOB) (cfs)
52+53 - 46+45.2	1218	0
45+39.6 – 42+39.6	757	0
42+39.6 – 38+21.2	1552	0
38+21.2 – 36+89.1	0	88

The breakout begins upstream of Telegraph Road, due to the lack of capacity in the Telegraph Road culvert. Therefore, the flows pond and overtop Telegraph Road as a sheet flow with a depth of approximately 1.5 feet. The northwest frontage of the proposed project extending from the main project entry west to the Barranca has been designed to handle 300 cfs within the parking lot between Telegraph Road and the proposed building. This overflow will be directed into the proposed channel along the west property line, with a total of 1,218 cfs, which totals the overflow from upstream of Telegraph Road on the east side of the Barranca.

The proposed condition will only occur if the property is developed. An 800 foot long parallel channel to Adams Canyon Barranca has been designed with a bottom width of 6.0' and a varying depth with 2:1 side slopes. The west side of the proposed channel adjacent to Adams Canyon Barranca will match the existing elevations until Adams Barranca reaches the west property boundary of the Specific Plan area and the two channels merge into one. This channel is only for the purposes of flood water routing.

At the merge location, we are proposing a wider channel section for debris storage. In discussions with Fillmore & Western railroad, they believe the railroad crossing gets clogged with debris. In order to accommodate the debris and enlarge the crossing capacity, we are proposing a wider channel section and a double 12’W x 6’H culvert to the east of the existing crossing.

Downstream of the railroad crossing, we are proposing to widen the channel by removing the existing easterly bank of the Barranca, making the bottom width 60’. However, the undersized Highway 126 12’Hx10’W double box culvert is causing the water to overtop the new channel configuration banks. The new easterly channel top of bank elevation will not exceed the elevation of the westerly top of bank of the Adams Barranca. The east side of the new channel will also have a lower weir cut at elevation 125 for a length of 75 feet between stations 28+39.2 and 27+08.7, just upstream of the Highway 126 undercrossing. This will allow the water to overtop the weir and head west to the natural low point in Highway 126, maintaining the existing condition flow path during a storm event. Therefore the proposed condition will not have an adverse impact on floodwaters heading to the west because the design is not increasing the peak flows or changing the overtopping location from the existing condition. The buildings are proposed at a minimum of 1.0’ above the water surface elevation determined for the new channel to protect from flooding (See Exhibit B).

Table 6 – Adams Barranca Proposed Overflow Values

Main Channel Station	Overtop Flow West (ROB) (cfs)	Overtop Flow East (LOB) (cfs)
52+53 – 46+45.2	1218	0
45+39.6 – 42+39.6	737	0
42+39 - 38+21	1290	0
28+39 – 27+55.9	0	1000
24+24 – 18+18	45	147

Conclusions

Based on the hydrology calculations done in accordance with the Ventura County Hydrology Manual and reflected in **Appendix C**, the proposed project improves existing drainage conditions and does not allow an increase in peak flow leaving the site. **Table 3** shows a comparison of the

flows at the five outlet points that does not include detention calculations. The increase in flow is anticipated due to the proposed development. To improve existing conditions dramatically, the project drainage design includes an overflow channel, smaller localized detention basins, and surface treatment swales. Existing flow patterns will generally remain the same after the proposed condition. The existing downstream storm drain facilities are currently not operating at their design capacity for a 10-year storm event. The proposed improvements will alleviate this situation.

APPENDIX F

Adams Barranca HEC-RAS Analysis Maps and Calculations

Adams Canyon – Hydraulic Analysis Report

Introduction

Adams Canyon is located in the unincorporated areas of Ventura County, California. The study was performed for 1.05 miles of the stream. The extent of the stream is from the confluence with the Santa Clara River and continuing upstream to 800 ft north of Telegraph Road. The channel is earthen. The entire study reach area is agricultural. There are three bridges in the study extent namely East Telegraph Road, Union Pacific Railroad and Highway 126. The stream was a natural channel consisting of minor vegetation.

Structure Data

The structure information for East Telegraph Road and Union Pacific Railroad is obtained from the field reconnaissance and information provided by CalTrans and record drawings from the County. The information was incorporated in this analysis.

	Model Type
Telegraph Road	Culvert
Railroad	Bridge
Highway 126	Two Culverts

Terrain Data

LIDAR data was provided by Ventura County. The data was in the form of mass points (each point was attributed with latitude, longitude and elevation), with a horizontal datum of NAD 1983 with projection of “*State Plane California V FIPS 0405 Feet*” and the vertical datum is “*NAVD 88*”. These points were used to generate a surface with 1’ and 5’ contour intervals in Sufer 8. The surface was then converted to a CAD drawing lowered by 2.5 feet to match the NGVD 29 datum that a flown aerial topo was generated by Central Coast Mapping in March 2007.

Streamline and Flow Paths

- Streamline was generated using the flowline of the Adams Barranca.
- Overland Flowpaths were generated following the west and east side of the bank contours and path of travel for the overflow water.
- Lateral structure elevations were determined by topography

Cross Section Generation

Cross-sections geometry was extracted from the terrain. Each cross-section was oriented such that it is normal to the floodplain.

Manning’s Roughness Coefficient (n) Calculations

Manning’s coefficient values were determined for each cross section using the Cowan (1956) procedure outlined in “*Guide for Selecting Manning’s Roughness Coefficients for Natural Channels and Floodplains*” (Authors: G.J. Arcement and V.R. Schneider, USGS Water supply Paper 2339). Photographs taken during field reconnaissance were used in conjunction with the aerial images to estimate Manning’s coefficients for the channel

portion of the cross section. For overbank areas, land-use classification data was developed from the aerial imagery. Polygons were digitized for different landuses, which were attributed with the corresponding Manning's n values. Manning's n value of 0.045 was used for the main channel and between 0.03 and 0.035 for the overbanks. See attached computation table (Attachment 1).

Boundary Conditions

For a downstream WS Elevation in SC River from FIRM 06111C0779E, we used 208.25 on the 88 datum, and lowered it 2.5' to be on the '29 datum = 205.75

Discharge Point Locations

Discharges for the Adams Barranca vary depending on the source. Ventura County Watershed Protection District current adopted flow rate is from the HSPF Model of 6,880 cfs. A revised discharges was provided by VCWPD in Appendix L Ventura Design Storm by Mark Banduraga of 5,150 cfs. A separate VcRAT analysis was completed by Jensen Design & Survey using aerial reduction totaling 4,810 cfs. The varying discharges are shown in the table below:

	100-Year
HSPF Model	
VCWPD	6,880
HMS Model	
VCWPD	5,150
JDS Model	4,810

HEC-RAS Project – Existing

- **PLANS:** The name of the project is 4492_Adams Barranca.prj
 - Adams Canyon - Plan With Embankment (p05, g05, f02)
 - **Adams Canyon – Plan With Embankment with lateral structures at top of bank (p12, g09, f02) – used for Specific Plan Report**
 - **Right Overbank**
 - **Adams Canyon Right Overbank Profile (p18, g13, f08)**
 - **Left Overbank**
 - **Adams Canyon Left Overbank Profile (p17, g14, f07)**

Discharges in the main stream were reduced using lateral structures for the without embankment scenario and balanced appropriately with the right and left overbank as shown in the table below for the **EXISTING** condition:

LOB_RS	100-YR
5096.3	1218
4223.5	1306

ROB_RS	100-YR
4966.8	1
4634	757
4222.5	2308

Methodology Existing Condition

Plan 5: With Embankment Plan and levees

- The channel embankments had higher elevations than the overbank areas. The embankments in this case act as levees, but do not satisfy levee requirements as per 65.10 and hence need to be failed as directed by FEMA Regional Engineer during field reconnaissance.
- Levees option was used on the crest of the levee, and their elevations were arbitrarily raised above the 0.2-percent annual chance water surface elevation as mentioned in Appendix H: Guidance for Mapping of Areas Protected by Levee Systems of the FEMA Guidelines and Specifications for Flood Hazard Mapping Partners.
- In this analysis only the channel portion was analyzed through out the length of the stream and the cross sections were cut off using levee option to consider only the areas within the embankments.

Plan 12: With Embankment Plan with lateral structures

- Lateral structures were placed on top of the embankments on *both* sides and were optimized
- The use of lateral structures reduced the flow in the channel. Some amount of water overtopped the channel embankments as they exist in the field and the rest of the water flowed through the channel.

Plan 17: Right overbank

- An overbank flowline was delineated using 1 foot contours on the right (west) overbank
- The cross-sections were taken parallel to the contours in the overflow area
- The flow rates were determined using the overflow from the lateral structures on the right side of Plan 12.

Plan 18: Left overbank

- An overbank flowline was delineated using 1 foot contours on the left (east) overbank
- The cross-sections were taken parallel to the contours in the overflow area
- The flow rates were determined using the overflow from the lateral structures on the left side of Plan 12.

HEC-RAS Project – Proposed

- **PLANS:** The name of the project is 4492_Adams Barranca.prj
 - Adams Canyon – Proposed Geometry – larger channel section between 126 and RR and Lateral structures, no parallel channel at the north end (p7, g10, f03)
 - **Adams Canyon – Proposed Geometry – larger channel section and parallel channel on north end of project (p19, g11, f05)**
 - **Right Overbank**
 - **Adams Canyon Right Overbank Profile (p22, g13, f06) (used same alignment and sections as existing condition)**
 - **Left Overbank**
 - **Adams Canyon Left Overbank Profile (p21, g12, f09)**

Discharges in the main stream were reduced using lateral structures for the without embankment scenario and balanced appropriately with the right and left overbank as shown in the table below for the **PROPOSED** condition:

LOB_RS	100-YR
3711.2	1000
1067.7	1147

ROB_RS	100-YR
4966.8	1
4634	738
4222.5	2028
284.2	2073

Methodology Proposed Condition

Plan 19: Proposed Geometry

- It was observed on the Existing condition (Plan 12) that a break out of 1,215 cfs occurred upstream of Telegraph Road and Traveled over telegraph Road to the frontage of the project site. We have designed this overflow condition to be captured in the parking lot and diverted to the west and then to the south in a parallel channel. The proposed buildings are protected from the 100 year water surface elevation.
- A flow file was created based on the assumption that at the beginning of the new channel (easterly end) the flow rate would start at 300 cfs. Then it would increase to the full 1,215 cfs at the northwesterly property corner before heading south. 8.
- The proposed channel is joined with the existing channel upstream of station 3525.2. The channel is then widened to accommodate the additional 1,215 cfs added to the system.

- It was noticed that the water was overtopping the existing top of bank on the west side of the channel downstream of the railroad. This was not occurring in the existing condition and therefore the proposed widened channel is proposed to have a notch cut in the top between stations 2839.2 and 2708.7 to allow the water to overflow to the east through the frontage road and over the highway, as it did in the existing condition. Therefore no impacts will occur on the west side of the barranca.

Plan 22: Right overbank

- An overbank flowline was delineated using 1 foot contours on the right (west) overbank
- The cross-sections were taken parallel to the contours in the overflow area
- The flow rates were determined using the overflow from the lateral structures on the right side of Plan 19.

Plan 21: Left overbank

- An overbank flowline was delineated using 1 foot contours on the left (east) overbank
- The cross-sections were taken parallel to the contours in the overflow area, which is a lower portion of the east side of the channel between stations 2839.2 and 2708.7.
- The flow rates were determined using the overflow from the lateral structures on the left side of Plan 19.

Mapping

BFEs for the main channel are obtained from Plan # 12 and Plan #19.

BFEs for the left overbank are obtained from Plan # 18 & #21.

BFEs for the right overbank are obtained from Plan # 17 & #22

5. Dense willows, summer, straight	0.110	0.150	0.200
3. Mountain Streams, no vegetation in channel, banks usually steep, with trees and brush on banks submerged			
a. Bottom: gravels, cobbles, and few boulders	0.030	0.040	0.050
b. Bottom: cobbles with large boulders	0.040	0.050	0.070

Table 3-1 (Continued) Manning's 'n' Values

Type of Channel and Description	Minimum	Normal	Maximum
<i>C. Excavated or Dredged Channels</i>			
1. Earth, straight and uniform			
a. Clean, recently completed	0.016	0.018	0.020
b. Clean, after weathering	0.018	0.022	0.025
c. Gravel, uniform section, clean	0.022	0.025	0.030
d. With short grass, few weeds	0.022	0.027	0.033
2. Earth, winding and sluggish			
a. No vegetation	0.023	0.025	0.030
b. Grass, some weeds	0.025	0.030	0.033
c. Dense weeds or aquatic plants in deep channels	0.030	0.035	0.040
d. Earth bottom and rubble side	0.028	0.030	0.035
e. Stony bottom and weedy banks	0.025	0.035	0.040
f. Cobble bottom and clean sides	0.030	0.040	0.050
3. Dragline-excavated or dredged			
a. No vegetation	0.025	0.028	0.033
b. Light brush on banks	0.035	0.050	0.060
4. Rock cuts			
a. Smooth and uniform	0.025	0.035	0.040
b. Jagged and irregular	0.035	0.040	0.050
5. Channels not maintained, weeds and brush			
a. Clean bottom, brush on sides	0.040	0.050	0.080
b. Same as above, highest stage of flow	0.045	0.070	0.110
c. Dense weeds, high as flow depth	0.050	0.080	0.120
d. Dense brush, high stage	0.080	0.100	0.140

Other sources that include pictures of selected streams as a guide to n value determination are available (Fasken, 1963; Barnes, 1967; and Hicks and Mason, 1991). In general, these references provide color photos with tables of calibrated n values for a range of flows.

Although there are many factors that affect the selection of the n value for the channel, some of the most important factors are the type and size of materials that compose the bed and banks of a channel, and the shape of the channel. Cowan (1956) developed a procedure for estimating the effects of these factors to determine the value of Manning's n of a channel. In Cowan's procedure, the value of n is computed by the following equation:

Table 3-1 (Continued) Manning's 'n' Values

Type of Channel and Description	Minimum	Normal	Maximum
B. Lined or Built-Up Channels			
1. Concrete			
a. Trowel finish	0.011	0.013	0.015
b. Float Finish	0.013	0.015	0.016
c. Finished, with gravel bottom	0.015	0.017	0.020
d. Unfinished	0.014	0.017	0.020
e. Gunitite, good section	0.016	0.019	0.023
f. Gunitite, wavy section	0.018	0.022	0.025
g. On good excavated rock	0.017	0.020	
h. On irregular excavated rock	0.022	0.027	
2. Concrete bottom float finished with sides of:			
a. Dressed stone in mortar	0.015	0.017	0.020
b. Random stone in mortar	0.017	0.020	0.024
c. Cement rubble masonry, plastered	0.016	0.020	0.024
d. Cement rubble masonry	0.020	0.025	0.030
e. Dry rubble on riprap	0.020	0.030	0.035
3. Gravel bottom with sides of:			
a. Formed concrete	0.017	0.020	0.025
b. Random stone in mortar	0.020	0.023	0.026
c. Dry rubble or riprap	0.023	0.033	0.036
4. Brick			
a. Glazed	0.011	0.013	0.015
b. In cement mortar	0.012	0.015	0.018
5. Metal			
a. Smooth steel surfaces	0.011	0.012	0.014
b. Corrugated metal	0.021	0.025	0.030
6. Asphalt			
a. Smooth	0.013	0.013	
b. Rough	0.016	0.016	
7. Vegetal lining			
	0.030		0.500

SANTA PAULA WEST BUSINESS PARK PRELIMINARY DRAINAGE REPORT

Introduction

The Santa Paula West project is a planned commercial and industrial development containing a mixture of industrial, research and development, retail, office and commercial uses. The Specific Plan project site is located just outside the limits, but within the sphere of influence, of the City of Santa Paula. The land use is currently agricultural. The property is bounded by industrial development on the east, Adams Barranca on the west, Telegraph Road to the north, and Highway 126 to the south. Splitting the northerly section of the specific plan area east/west is the railroad operated by the Ventura County Transportation Commission Railroad (VCTC). The property ranges in elevation from approximately 250 to 222 feet above mean sea level and generally slopes from the north to the south. The Regional Location Map is shown below as Figure 1.

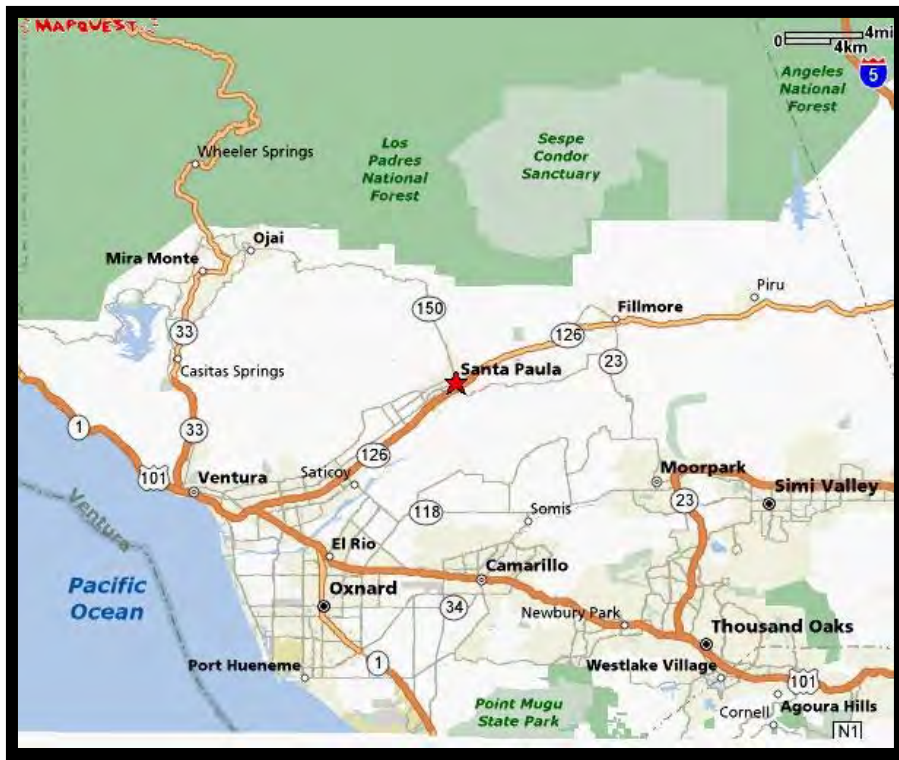

FIGURE 1 - REGIONAL LOCATION MAP

Project Description

The Santa Paula West Business Park Specific Plan encompasses approximately 58 acres of land in unincorporated Ventura County west of the City of Santa Paula. The proposed Specific Plan would permit the development of a variety of clean office, industrial and retail buildings ranging in size.

Access to the site is provided by Beckwith Road, Telegraph Road, and Faulkner Road. Figure 2 shows the project location.

FIGURE 2 – PROJECT LOCATION MAP

Purpose

This study provides an evaluation of the existing drainage conditions and the design of a preliminary storm drain system within the Santa Paula West Business Park Specific Plan project.

The general approach of the proposed condition is to maintain the existing drainage pattern without having adverse affects offsite.

Existing site conditions show that the project site is located in a floodplain, Zone A. Based on our analysis of Adams Canyon Barranca using flows generated by an Existing Condition study by Jensen Design & Survey reviewed and approved by the County of Ventura Watershed Protection District in December 2011 (see **Appendix A**), the floodplain limits currently shown by FEMA are inaccurate. This report also summarizes the flow information that will be used in Adams Barranca for a HEC-RAS analysis for a CLOMR/LOMR to be filed at a later date to modify the current FIRM maps.

Future site runoff will be conveyed through the project via surface drainage and underground structures connecting into the existing culverts under Highway 126. This report includes hydrologic analysis and supporting calculations to demonstrate how the project's contributions to stormwater runoff resulting from development will be controlled and match existing conditions at major outlet points.

Hydrology Methodology

The existing conditions of the Santa Paula West Business Park Specific Plan were determined according to the Ventura County Watershed Protection District 2010 Hydrology Manual, the City of Santa Paula Master Plan for Drainage, the County's Time of Concentration Calculator, and Hec-Ras.

- Soil Group Types 3 & 4 are used for drainage areas in this study
- Existing condition coefficients were obtained from Appendix A, Exhibit 6A of the 'VCWPD Hydrology Manual'.
- Proposed condition coefficients were obtained from Appendix A, Exhibit 6A of the 'VCWPD Hydrology Manual'.
- Time of Concentration (Tc) values were calculated with the Tc Calculator program for each drainage area.
- Water quality treatment will be flow based and volume based, according to current SQUIMP guidelines at the time of Tentative Map submittal. Various areas can be used

for treatment, infiltration, and detention that will meet or exceed the County's SQUIMP requirements according to the Ventura County Technical Manual.

Existing Drainage Conditions

The Santa Paula West Business Park site is located within the greater Santa Clara River watershed. The onsite drainage is a tributary to the Santa Clara River, and has been divided into four drainage areas: Adams Canyon Barranca (Area A), Todd Lane Drain (Area D), Highway 126 West culverts (Area B), and Highway 126 east culverts (Area C). The limits of the drainage subareas were determined by a flown aerial topo (NGVD 1929 datum) and a site visit. In performing the hydrology analysis for the existing condition, all of the drainage areas within the property limits were analyzed for a ten through a hundred year storm events. The subarea properties and the calculated runoff are shown in **Table 1 and in Appendix A**.

The 58 acre project site is currently used for agriculture and varies in land gradient sloping north to south with the railroad and the Highway being higher than adjacent grade and acting as dams. The railroad has two culverts (2-12" CMP and 1-24" CMP) to transport the onsite water from the north to the south, not including the crossing for Adams Barranca. These culverts are about 50% blocked with sediment and currently do not function at capacity. There are also four existing culverts of various sizes under Highway 126 that are blocked with sediment and do not function at capacity, causing ponding north of the Highway during storm events. The outlets of the culverts are on the south side of Highway 126 and drain through historic agricultural drainage channels ending in the Santa Clara River and do not connect to Adams Barranca.

A small portion of the property drains west into Adams Barranca (**Area A on Exhibit A**). Adams Barranca is a raised channel with the top of the channel being an average 2.0' higher than the adjacent grade on the property for approximately 480' extending north from HWY 126. This property is subject to flooding during a 100 year storm event from Adams Barranca, according to the current FIRM maps (Map Numbers 06111C0778E and 06111C0779E – **Appendix E**). A HEC-RAS analysis was completed using flow information from a VcRAT analysis completed by Jensen Design & Survey to support a change in the floodplain limits. A more detailed analysis will be completed at the Tentative Map level of review and will be coordinated with the County and City. The existing condition report for the flow rates used in the HEC-RAS analysis has been reviewed and approved by the County Watershed Protection District on December 6, 2011.

The Highway 126 westerly culverts (1-24" CMP, and 1-48"x24" Arch CMP), drainage area B, handle the flows from approximately 27.3 acres. Overflow from pipe inlet blockage travels

SANTA PAULA WEST BUSINESS PARK PRELIMINARY DRAINAGE REPORT

easterly to two other culverts under Highway 126 or farther east to the inlet at the end of Faulkner Road into a 72” RCP leading to Todd Lane Drain.

The Highway 126 easterly culverts (2–52”x30” Arch CMP), drainage areas C and D, handle the flows from approximately 31 acres. Overflow from pipe inlet blockage travels easterly to the inlet at the end of Faulkner Road into a 72” RCP leading to Todd Lane Drain.

The time of concentration for each overall drainage area within the property boundaries was calculated using VcRAT Time of Concentration calculator from Ventura County to obtain a time of concentration and a peak flow rate. That peak flow rate was used to calculate a cfs/acre which was then applied to each drainage subarea, respectively as shown in **Appendix A**.

The Santa Paula Master Storm Drain Plan shows 75% of the specific plan area to be draining to Todd Lane Drain. Todd Lane Drain has a maximum design capacity of 393 cfs in a 100 year storm. After an analysis of the onsite drainage patterns, Todd Lane Drain receives flows from the project site only in the event of blockage at the Highway 126 culverts.

Highway 126 westbound lane drains northerly through an asphalt down drain into Culvert 2. With the proposed improvements for the project, an inlet will need to be added to capture this flow and route it under the freeway per existing conditions.

The existing flow areas and peak flows for the existing condition are shown in Appendix A and Table 1.

Table 1A – Santa Paula West Business Park Specific Plan Existing Runoffs

Watershed	Subarea	Area (ac.)	10-year	50-year	100-year
			Q10 (cfs)	Q50 (cfs)	Q100 (cfs)

	D	7.26	7.9	14.0	19.6
	TOTAL	30.6	24.9	45.5	60.9

Proposed Drainage Conditions

The proposed grading and drainage (see **Appendix D, Exhibit B**) shows the site maintaining the flow pattern. The project has a slope of 3%. The site will be mostly fill in order to raise the buildings away from any flooding potential. Various catch basin locations and a local storm drain system, designed to current City of Santa Paula Standards will convey the stormwater to five different outlet points, as shown on **Exhibit B**. The storm drain system is a network of PVC pipe routed within the project site and flows by gravity. A parallel channel has been incorporated into plans to improve the Adams Barranca flooding condition, and will be further explained later in this report. No onsite stormwater will be directed to the Barranca.

The project will take advantage of planter areas throughout to allow for infiltration and treatment of rain water to comply with the County of Ventura MS4 permit. Before the stormwater leaves the site, it will be detained in small localized landscaped basins and three larger basins onsite to allow for infiltration and peak flow control per current MS4 standards at the time of Tentative Map submittal. Storm drain sizes and slopes will be determined once site layout is finalized at the Tentative Map level.

The five outlet points for onsite water discharge are Todd Lane Drain (Pipe 9), three existing culvert locations under Highway 126 (pipes 2,5,&8). Proposed condition stormwater discharge at each outlet point will not increase from the existing peak outflow (**Appendix C**), due to the implementation of detention basins. Preliminary calculations have been done to size the proposed detention basins, however a more detailed analysis will be required at the Tentative Map level, once the site layout is completed. There are two surface detention basins located on site and one subsurface detention basin located on the east end of the development (see **Appendix D, Exhibit B**).

Most of the existing condition drainage issues onsite are due to sediment build up in the existing storm drain pipes under Highway 126. By developing the site, undergrounding existing open inlet pipes at Highway 126, and providing a system for treatment and flow control, the site will not be exposed to sediment and the usual culvert blockage that can cause ponding north of Highway 126 will be eliminated.

SANTA PAULA WEST BUSINESS PARK PRELIMINARY DRAINAGE REPORT

The time of concentration for drainage areas C and D within the property boundaries was calculated using VcRAT Time of Concentration calculator from Ventura County to obtain a time of concentration and a peak flow rate for developed condition. The peak flow rate for these two areas was used to calculate a cfs/acre, which was then applied to each drainage subarea, respectively as shown in **Appendix C** and Table 2A. For area B the time of concentration was also calculated using VcRAT Time of Concentration calculator from Ventura County. Area B was subdivided into B1 and B2 to obtain a time of concentration for each subarea. This time was used to calculate a peak flow rate for the developed condition

Water Quality

Water quality measures for the Santa Paula West Business Park development will consist of Best Management Practices (BMPs) that are listed in the Ventura County Stormwater Quality Urban Impact Mitigation Plan (SQUIMP). This plan was devised to address storm water pollution for any new development and redevelopment. Stormwater treatment occurs onsite prior to stormwater leaving the site to existing drainage facilities. Water quality treatment will either be flow based, volume based, or a combination of the two according to SQUIMP guidelines. The following are some of the BMPs that may be utilized on our project.

Vegetated-swales will be designed into various parking landscape areas to convey and treat paved areas and allow stormwater capture for infiltration and evapotranspiration. These swales that generally have low velocities are used to mitigate concentration of nutrients by its contact with vegetation. Vegetated-swales could occur within each planter area designed within the project, providing cleansing of storm runoff prior to discharge into Adams Barranca and Santa Clara River.

Bio-filter inserts will be used in curb inlets to capture oil and grease, suspended solids, metals, gasoline, pesticides and pathogens. Also, storm drain inlets and catch basins will have proper signage and stenciling to discourage illegal dumping. Filters and signage will be checked and/or replaced annually.

SANTA PAULA WEST BUSINESS PARK PRELIMINARY DRAINAGE REPORT

For proposed development, two surface detention basins are located onsite north of the railroad at the center of the development and north of the highway at the center of the development in addition to one underground basin located east of Beckwith Drive just north of the highway. Localized detention basins will also be used throughout the site, such as landscape areas that are used to lag the discharge of stormwater. These areas will settle out and filter pollutants that are within the runoff on-site. The final sizing of the detention basins and landscape areas will be provided with the Tentative Map design.

The following table shows the volume required for each drainage area according to the SQUIMP guidelines and the Tentative Stormwater Permit for Ventura County as of the date of this report for water quality treatment. The Railroad Right of Way area is not included in the treatment volume requirements.

Table 3 – Santa Paula West Business Park Specific Plan Water Quality

Subarea	Drainage Area (acres)	Railroad Right of Way Area (acres)	Total Required Treatment Area (acres)	Volume Based Water Quality Required (ft ³)**
A	2.5	0.1	0.0	0.0

			Total Volume	110348.3

** Calculated using a 75% impervious area average

Used method in SQUIMP manual page 5-5 for calculations
(same value as a 0.75 in storm event as stated in new permit)

Adams Canyon Barranca Floodplain Analysis

Current FIRM maps dated January 20, 2010 show the westerly portion of the property within flood Zone A (See **Appendix E**). After a review of historic flooding, existing contours, and site features, the Flood Zone limits shown on the current FIRM maps are inaccurate. Using flows generated by a VcRAT study completed by Jensen Design & Survey adopted in December 2011 by the County of Ventura Watershed Protection District, a preliminary HEC-RAS River study of Adams Canyon Barranca was completed.

Adams Canyon Barranca’s current banks are earthen dikes created by past farm land owners in order to prevent flooding their crops. These dikes are about 2.0 feet above adjacent grade on both the east and west sides of the channel. The Barranca and the undercrossings at Highway 126, the Railroad, and Telegraph road are undersized for the 5,861 cfs flow.

Table 4 – Adams Barranca Existing Structures

	Type of Undercrossing	Approximate Capacity (cfs)
Telegraph Road	10’ H x 24’ W RCB	3,200
Railroad Crossing	8’ H x 28’ W Crossing	2,400
Highway 126	Double 12’ H x 10’ W	2,200

Multiple HEC-RAS analysis were completed to support our findings. A summary of the HEC-RAS plans and geometry files are in the **Appendix F**. The existing condition where the channel geometry is overtopped was modeled using lateral structures as weirs at the top of the existing bank to analyze the flow that has left the channel. Existing condition topography reflects that if water overtops the channel, it will leave the channel forever and head either east or west to Todd Barranca or Clow Road undercrossing, respectively. The flow rates that overtopped the bank on the west side of the Barranca were removed from the total design Q for the proposed condition analysis at each respective cross section. The summary of the flow rates that have overtopped the existing banks at certain locations is shown below and in **Appendix F**.

The breakout begins upstream of Telegraph Road, due to the lack of capacity in the Telegraph Road culvert. Therefore, the flows pond and overtop Telegraph Road as a sheet flow with a depth of approximately 1.5 feet. The northwest frontage of the proposed project extending from the main project entry west to the Barranca has been designed to handle 300 cfs within the parking lot between Telegraph Road and the proposed building. This overflow will be directed

into the proposed channel along the west property line, with a total of 2,637cfs, which totals the overflow from upstream of Telegraph Road on the east side of the Barranca.

The proposed condition will only occur if the property is developed. An 1,700 foot long parallel channel to Adams Canyon Barranca has been designed with a bottom width of 20' and a varying depth with 2:1 side slopes. The west side of the proposed channel adjacent to Adams Canyon Barranca will match the existing elevations until Adams Barranca reaches Hwy 1226. At this point a notch cut at the easterly channel banks is proposed to act as a weir. Flood flows will initially flow to the east into a widen channel through the frontage road and over the highway, as it did in the existing condition. Some flow will go back into Adams Barranca Creek at Hwy 126 however this will be controlled via a weir to prevent overtopping of the west bank therefore no impacts will occur on the west side of the Barranca.

The buildings are proposed at a minimum of 1.0' above the water surface elevation determined for the new channel to protect from flooding (See Exhibit B).

Conclusions

Based on the hydrology calculations done in accordance with the Ventura County Hydrology Manual and reflected in **Appendix C**, the proposed project improves existing drainage conditions and does not allow an increase in peak flow leaving the site. To improve existing conditions, the project drainage design includes an overflow channel, smaller localized detention basins, and surface treatment swales. Existing flow patterns will generally remain the same after the proposed condition. The existing downstream storm drain facilities are currently not operating at their design capacity for a 10-year storm event. The proposed improvements will alleviate this situation.

APPENDIX F

Adams Barranca HEC-RAS Analysis Maps and Calculations

Adams Canyon – Hydraulic Analysis Report

Introduction

Adams Canyon is located in the unincorporated areas of Ventura County, California. The study was performed for 1.2 miles of the stream. The extent of the stream is from the confluence with the Santa Clara River and continuing upstream to 1,600 ft north of Telegraph Road. The channel is earthen. The entire study reach area is agricultural. There are three bridges in the study extent namely East Telegraph Road, Union Pacific Railroad and Highway 126. The stream was a natural channel consisting of minor vegetation.

Structure Data

The structure information for East Telegraph Road and Union Pacific Railroad is obtained from the field reconnaissance and information provided by CalTrans and record drawings from the County. The information was incorporated in this analysis.

	Model Type
Telegraph Road	Culvert
Railroad	Bridge
Highway 126	Two Culverts

Terrain Data

A flown aerial topo was generated by Central Coast Mapping in March 2007 with an assumed horizontal datum and a vertical datum of NGVD 29. The data from the flown aerial was re-projected to “*State Plane California V FIPS 0405 Feet*” and raised 2.39’ to convert the data to NAD 1983 horizontal datum and “*NAVD 88*” vertical datum.

LIDAR data was provided by Ventura County. The data was in the form of mass points (each point was attributed with latitude, longitude and elevation), with a horizontal datum of NAD 1983 with projection of “*State Plane California V FIPS 0405 Feet*” and the vertical datum is “*NAVD 88*”.

These two data sources were used to generate a surface with 1’ and 5’ contour intervals in Civil3D.

Streamline and Flow Paths

- Streamline was generated using the flowline of the Adams Barranca.
- Overland Flowpaths were generated following the west and east side of the bank contours and path of travel for the overflow water.
- Lateral structure elevations were determined by topography

Cross Section Generation

Cross-sections geometry was extracted from the terrain. Each cross-section was oriented such that it is normal to the floodplain.

Manning’s Roughness Coefficient (n) Calculations

Manning’s coefficient values were determined for each cross section using the Cowan (1956) procedure outlined in “Guide for Selecting Manning’s Roughness Coefficients for Natural Channels and Floodplains” (Authors: G.J. Arcement and V.R. Schneider, USGS Water supply Paper 2339). Photographs taken during field reconnaissance were used in conjunction with the aerial images to estimate Manning’s coefficients for the channel portion of the cross section. For overbank areas, land-use classification data was developed from the aerial imagery. Polygons were digitized for different landuses, which were attributed with the corresponding Manning’s n values. Manning’s n value of 0.045 was used for the main channel and between 0.03 and 0.035 for the overbanks. See attached computation table (Attachment 1).

Boundary Conditions

For a downstream WS Elevation in SC River from FIRM 06111C0779E, we used 208.25 on the 88 datum.

Discharge Point Locations

Discharges for the Adams Barranca vary depending on the source. Ventura County Watershed Protection District current adopted flow rate is from the HSPF Model of 6,880 cfs. A revised discharges was provided by VCWPD in Appendix L Ventura Design Storm by Mark Banduraga of 5,150 cfs. A separate VcRAT analysis was completed by Jensen Design & Survey using aerial reduction totaling 5,861cfs. The varying discharges are shown in the table below:

	100-Year
HSPF Model	
VCWPD	6,880
HMS Model	
VCWPD	5,150
JDS Model	5,861

For this analysis we used a peak flow of 5,861.

HEC-RAS Project – Existing

- **PLANS:** The name of the project is 4492_Adams Barranca.prj
 - **Adams Canyon**
 - **Plan With Embankment (p01, g01, f01)**
 - **Right Overbank**
 - **Adams Canyon Right Overbank Profile (p04, g02, f03)**
 - **Left Overbank**
 - **Adams Canyon Left Overbank Profile (p03, g04, f02)**

Discharges in the main stream were reduced using lateral structures for the with Embankment Plan with lateral structures(Plan 1) and balanced appropriately with the right and left overbank as shown in the table below for the **EXISTING** condition:

LOB_RS	100-YR
5246	2191
3370	101

ROB_RS	100-YR
5221.1	1359
3525.7	1297

Methodology Existing Condition

Plan 1: With Embankment Plan with lateral structures

- Levees were modeled using lateral structures in accordance with the Levee Analysis and Mapping Procedures released by FEMA in 2013 which outlines different modeling approaches for non-accredited levees.
 - Lateral structures were used to establish breaches in areas where the levees had a steep slope towards the landward side of the floodplain.
 - In areas where the levees were gradually sloping and potential for failures is lower the mapping was done by assuming the levees were topographic feature that did not impede flow.
- Flow in the main channel was reduced by optimizing the lateral structures.

Plan 2: Right overbank

- An overbank flowline was delineated using 1 foot contours on the right (west) overbank
- The cross-sections were taken parallel to the contours in the overflow area
- The flow rates were determined using the overflow from the lateral structures on the right side of Plan 1.

Plan 3: Left overbank

- An overbank flowline was delineated using 1 foot contours on the left (east) overbank
- The cross-sections were taken parallel to the contours in the overflow area
- The flow rates were determined using the overflow from the lateral structures on the left side of Plan 1.

HEC-RAS Project – Proposed

- PLANS: The name of the project is 4492_Adams Barranca.prj
 - **Proposed Adams Canyon - Plan With Embankment Main channel Overbank**
 - **A flood control condition to capture overflow of the east banks and diverted to a parallel channel. Weir cut into Adams Barranca at the southerly end between section 2929.25 and 3159.25. (p06, g03, f05)**

- **Right Overbank**
 - **Adams Canyon Right Overbank Profile (p07, g05, f06) (used same alignment and sections as existing condition)**
- **Left Overbank**
 - **Adams Canyon Left Overbank Profile (p03, g04, f02)**
 - **Flow line taken along proposed parallel channel**

Discharges in the main stream were reduced using lateral structures balanced appropriately with the right and left overbank as shown in the table below for the **PROPOSED** condition:

LOB_RS	100-YR
5246	2177
3370	460

ROB_RS	100-YR
5221.1	1348
3525.7	855

Methodology Proposed Condition

Plan 4: Proposed Geometry

- It was observed on the Existing condition (Plan 1) that a break out of 2,178cfs occurred upstream of Telegraph Road and Traveled over telegraph Road to the frontage of the project site. We have designed this overflow condition to be captured in the parking lot and diverted to the west and then to the south in a parallel channel. The proposed buildings are protected from the 100 year water surface elevation.
- Additional break out of 187.3cfs occurs just North of Hwy 126.
- A flow file was created based on the assumption that at the beginning of the new channel (easterly end) the flow rate would start at 300 cfs. Then it would increase to the full 2178 cfs at the northwesterly property corner before heading south.
- The proposed channel that will handle overflows from the main channel in the 100yr event. It runs parallel to the property between Telegraph road and Hwy 126. At the Hwy the proposed overflow channel wraps to the east along Faulkner Road. Overflow will pond in Faulkner Rd and up to the Culdesac.
- A notch cut at the easterly channel banks between stations 2929.25 and 3159.25; This cut will act as a weir, flood flows will initially flow to the east into a widen channel through the frontage road and over the highway, as it did in the existing condition. Some flow will go back into Adams Barranca Creek at Hwy 126 however this will be controlled via a weir to prevent overtopping of the west bank therefore no impacts will occur on the west side of the Barranca .

Plan 5: Right overbank

- An overbank flowline was delineated using 1 foot contours on the right (west) overbank
- The cross-sections were taken parallel to the contours in the overflow area
- The flow rates were determined using the overflow from the lateral structures on the right side of Plan 4.

Plan 6: Left overbank

- An overbank flowline was delineated using 1 foot contours on the left (east) overbank following the flowline of the proposed flood control channel.
- The cross-sections were taken parallel to the contours in the overflow area
- A lower portion as observed along Hwy 126 on the east side of the channel between stations 2895.24 and 2684.37.
- The flow rates were determined using the overflow from the lateral structures on the left side of Plan 4.

Mapping

BFEs for the right overbank are obtained from Plan # 2 & #5

BFEs for the left overbank are obtained from Plan # 3 & #6

Table 3-1 Manning's 'n' Values

Type of Channel and Description	Minimum	Normal	Maximum
A. Natural Streams			
1. Main Channels			
a. Clean, straight, full, no rifts or deep pools	0.025	0.030	0.033
b. Same as above, but more stones and weeds	0.030	0.035	0.040
c. Clean, winding, some pools and shoals	0.033	0.040	0.045
d. Same as above, but some weeds and stones	0.035	0.045	0.050
e. Same as above, lower stages, more ineffective slopes and sections	0.040	0.048	0.055
f. Same as "d" but more stones	0.045	0.050	0.060
g. Sluggish reaches, weedy, deep pools	0.050	0.070	0.080
h. Very weedy reaches, deep pools, or floodways with heavy stands of timber and brush	0.070	0.100	0.150
2. Flood Plains			
a. Pasture no brush	0.025	0.030	0.035
1. Short grass	0.030	0.035	0.050
2. High grass			
b. Cultivated areas	0.020	0.030	0.040
1. No crop	0.025	0.035	0.045
2. Mature row crops	0.030	0.040	0.050
3. Mature field crops			
c. Brush	0.035	0.050	0.070
1. Scattered brush, heavy weeds	0.035	0.050	0.060
2. Light brush and trees, in winter	0.040	0.060	0.080
3. Light brush and trees, in summer	0.045	0.070	0.110
4. Medium to dense brush, in winter	0.070	0.100	0.160
5. Medium to dense brush, in summer			
d. Trees	0.030	0.040	0.050
1. Cleared land with tree stumps, no sprouts	0.050	0.060	0.080
2. Same as above, but heavy sprouts	0.080	0.100	0.120
3. Heavy stand of timber, few down trees, little undergrowth, flow below branches	0.100	0.120	0.160
4. Same as above, but with flow into branches			
5. Dense willows, summer, straight	0.110	0.150	0.200
3. Mountain Streams, no vegetation in channel, banks usually steep, with trees and brush on banks submerged			
a. Bottom: gravels, cobbles, and few boulders	0.030	0.040	0.050
b. Bottom: cobbles with large boulders	0.040	0.050	0.070

Table 3-1 (Continued) Manning's 'n' Values

Type of Channel and Description	Minimum	Normal	Maximum
<i>C. Excavated or Dredged Channels</i>			
1. Earth, straight and uniform			
a. Clean, recently completed	0.016	0.018	0.020
b. Clean, after weathering	0.018	0.022	0.025
c. Gravel, uniform section, clean	0.022	0.025	0.030
d. With short grass, few weeds	0.022	0.027	0.033
2. Earth, winding and sluggish			
a. No vegetation	0.023	0.025	0.030
b. Grass, some weeds	0.025	0.030	0.033
c. Dense weeds or aquatic plants in deep channels	0.030	0.035	0.040
d. Earth bottom and rubble side	0.028	0.030	0.035
e. Stony bottom and weedy banks	0.025	0.035	0.040
f. Cobble bottom and clean sides	0.030	0.040	0.050
3. Dragline-excavated or dredged			
a. No vegetation	0.025	0.028	0.033
b. Light brush on banks	0.035	0.050	0.060
4. Rock cuts			
a. Smooth and uniform	0.025	0.035	0.040
b. Jagged and irregular	0.035	0.040	0.050
5. Channels not maintained, weeds and brush			
a. Clean bottom, brush on sides	0.040	0.050	0.080
b. Same as above, highest stage of flow	0.045	0.070	0.110
c. Dense weeds, high as flow depth	0.050	0.080	0.120
d. Dense brush, high stage	0.080	0.100	0.140

Other sources that include pictures of selected streams as a guide to n value determination are available (Fasken, 1963; Barnes, 1967; and Hicks and Mason, 1991). In general, these references provide color photos with tables of calibrated n values for a range of flows.

Although there are many factors that affect the selection of the n value for the channel, some of the most important factors are the type and size of materials that compose the bed and banks of a channel, and the shape of the channel. Cowan (1956) developed a procedure for estimating the effects of these factors to determine the value of Manning's n of a channel. In Cowan's procedure, the value of n is computed by the following equation:

Table 3-1 (Continued) Manning's 'n' Values

Type of Channel and Description	Minimum	Normal	Maximum
B. Lined or Built-Up Channels			
1. Concrete			
a. Trowel finish	0.011	0.013	0.015
b. Float Finish	0.013	0.015	0.016
c. Finished, with gravel bottom	0.015	0.017	0.020

EXECUTIVE SUMMARY

This report documents the assumptions, methodologies, and findings of a study conducted by Fehr & Peers to evaluate the potential traffic impacts of the proposed development under the Santa Paula West Business Park Specific Plan (Project) in the City of Santa Paula. The following summarizes the findings of the study:

- Weekday AM and PM peak hour capacity analyses were conducted at 16 intersections and 10 directional freeway segments on the local and regional street system near the project site. One of the 16 study intersections currently operates at level of service (LOS) D during the PM peak hour. The 10 directional freeway segments operate at LOS C or better during both peak hours. The results of the intersection analysis for existing (2014) and future (2031) conditions are summarized in Tables ES-1 and ES-2.
- The proposed Santa Paula West Business Park Specific Plan would guide a development within the project site that includes a total of 683,173 square feet (s.f.) of general light industrial space and 18,405 s.f. of retail space. It is estimated to generate approximately 5,546 daily trips on weekdays, with approximately 646 trips during the AM peak hour and 732 trips during the weekday PM peak hour. The project has been studied both with and without the Beckwith Road extension to Faulkner Road.
- Under existing plus project conditions, four analyzed intersections are projected to operate at or below LOS D (the standard adopted by the City) during at least one of the analyzed peak hours. Three analyzed intersections are projected to operate at or below LOS D during at least one of the analyzed peak hours without the Beckwith Road extension. The 10 directional freeway segments operate at LOS C or better during both peak hours.
- Under cumulative base conditions (Year 2031), four analyzed intersections are projected to operate at or below LOS D during at least one of the analyzed peak hours. The 10 directional freeway segments operate at LOS E or better during both peak hours. The cumulative base forecasts were developed using an ambient growth rate developed from the 2012 Southern California Association of Governments (SCAG) Regional Transportation Plan (RTP) Travel Demand Model and related projects provided by information from the City. The cumulative base forecasts include growth over existing traffic volumes to reflect the effects of overall regional growth and development outside the study area and traffic generated by specific cumulative development projects elsewhere in the City of Santa Paula.
- According to the significant impact criteria employed by the City of Santa Paula, the proposed project, both with and without the Beckwith Road extension, would cause or contribute to significant impacts at five intersections. Of the five intersections projected to operate at LOS D or worse under cumulative plus project conditions (Year 2031), four are projected to operate at LOS D or worse prior to the addition of project traffic. The significant impact at the other intersection is a result of LOS deteriorating to D or worse from traffic generated by the proposed project.
- Mitigation measures were developed to mitigate (to LOS D or better) the cumulative and project traffic impacts that were identified at the significantly impacted study intersections under both existing plus project and cumulative plus project scenarios. A partial mitigation measure was developed for one intersection and one intersection had no feasible mitigation.

CHAPTER 1. INTRODUCTION

This report documents the results of a traffic study conducted by Fehr & Peers to evaluate the potential impacts of the development under the Santa Paula West Business Park Specific Plan (Project) in the City of Santa Paula, California. The study provides analysis of future traffic conditions and potential traffic impacts on the roadway system associated with the project at completion in 2031. This document includes a description of the assumptions and methods used to conduct the study as well as a discussion of the results.

1.1 PROJECT DESCRIPTION

The Santa Paula West Business Park Specific Plan project site is located within the Sphere of Influence of the City of Santa Paula, with frontage along State Route 126 (SR-126), Beckwith Road, and Telegraph Road, and is crossed by the railroad right-of-way. Figure 1 presents the conceptual site plan, roadway network and external connections for the project. The southern boundary of the project area is SR-126, the northern boundary is Telegraph Road, the western boundary is agricultural land, and the eastern boundary is existing industrial and commercial development.

As proposed in the Santa Paula West Business Park Specific Plan at build-out in 2031, the development in the project area will include a total of 683,174 square feet (s.f.) of general light industrial space and 18,405 s.f. of retail space. The proposed project may also extend Beckwith Road from its current terminus north of the railroad tracks to Faulkner Road, creating a new at-grade crossing which would require regulatory approval. Two project options, or scenarios, are analyzed in this study: with and without the Beckwith Road extension.

1.2 STUDY SCOPE

The study analyzed potential project-related traffic impacts on the local and regional street system surrounding the project site. The following traffic scenarios were analyzed for the weekday AM peak hour (between 7:00 and 9:00 AM) and the weekday PM peak hour (between 4:00 and 6:00 PM).

- Existing Conditions (2014) – The analysis of existing traffic conditions provides a basis for the remainder of the study. The existing conditions analysis includes an assessment of streets, traffic volumes, and operating conditions.
- Existing plus Project Conditions (2014) – This is an analysis of the existing traffic conditions where traffic expected from the proposed project is added to existing traffic volumes. The objective of this phase of analysis is to identify impacts of the project with the extension of Beckwith Road to Faulkner Road.
- Existing plus Project Conditions without Beckwith Road Extension (2014) – This is an analysis of the existing traffic conditions where traffic expected from the proposed project is added to existing traffic volumes. The objective of this phase of analysis is to identify impacts of the project without the extension of Beckwith Road to Faulkner Road.
- Cumulative Base Conditions (Year 2031) – Future traffic conditions are projected without the proposed project. The objective of this phase of analysis is to project future traffic growth and operating conditions that could be expected to result from regional ambient growth and cumulative projects.
- Cumulative plus Project Conditions (Year 2031) – This is an analysis of future traffic conditions with traffic expected from the proposed project added to cumulative base traffic forecasts. The objective of this phase of the analysis is to identify potential impacts of the project with the extension of Beckwith Road to Faulkner Road.
- Cumulative plus Project Conditions without Beckwith Road Extension (Year 2031) – This is an analysis of future traffic conditions with traffic expected from the proposed project added to cumulative base traffic forecasts. The objective of this phase of analysis is to identify potential impacts of the project without the extension of Beckwith Road to Faulkner Road.

FIGURE 1
CONCEPTUAL SITE PLAN

The area of study encompasses most of Santa Paula, spanning from Briggs Avenue in the west to 10th Street in the east. The study includes 16 study intersections that were analyzed for each of the traffic scenarios described above. The selection of these intersections was based on input received from the City, as well as a review of previous studies. The study area is consistent with previous studies conducted for projects in the City. These study intersections are shown in Figure 2 and are listed below:

1. 10th Street & Harvard Boulevard
2. 8th Street & Main Street
3. 8th Street & Harvard Boulevard
4. Palm Avenue & Main Street
5. Palm Avenue & Harvard Boulevard
6. Steckel Drive & Main Street
7. Steckel Drive & Harvard Boulevard
8. Peck Road & Harvard Boulevard/Telegraph Road
9. Peck Road & Faulkner Road
10. Peck Road & SR-126 Eastbound On-/Off-Ramps
11. Faulkner Road & SR-126 Westbound On-/Off-Ramps
12. Beckwith Road & Telegraph Road
13. Briggs Road & Telegraph Road
14. Briggs Road & Faulkner Road
15. Briggs Road & SR-126 Westbound On-/Off-Ramps
16. Briggs Road & SR-126 Eastbound On-/Off-Ramps

Of the 16 study intersections, nine operate under signal control; the remaining seven operate under stop control. Diagrams of the lane configurations and signal control at the study intersections are provided in Appendix A.

1.3 ORGANIZATION OF REPORT

This report is divided into an Executive Summary and five chapters, including this introductory chapter. Chapter 2 describes the existing conditions, including the circulation system, traffic volumes, and traffic conditions in the study area. The methodologies used to forecast future traffic volumes are described in Chapter 3. Chapter 4 presents an assessment of potential traffic impacts and improvements for the existing plus project and cumulative plus project scenarios, i.e., conditions with the addition of project traffic. Chapter 5 presents an assessment of potential intersection traffic impacts of the proposed project without the Beckwith Road extension to Faulkner Road relative to both existing and future conditions. The report also presents discussion of the project's fair share contribution to the identified mitigation measures. Appendices to this report include details of the technical analysis.

CHAPTER 2. EXISTING (2014) CONDITIONS

A comprehensive data collection effort was undertaken to develop a detailed description of existing conditions in the study area. The assessment of conditions to this study includes an inventory of the street system, traffic volumes on these facilities, and operating conditions at key intersections.

2.1 EXISTING STREET SYSTEM

Primary regional access is provided by SR-126, which runs east-west. Secondary regional access is provided by Ojai Road (SR-150)/10th Street and 12th Street/South Mountain Road in the north and south directions, respectively. Immediately to the north of the project site is Telegraph Road, and immediately south of the project site is SR-126. Faulkner Road also fronts the project site just north of SR-126. The closest adjacent north-south streets providing access to the project site are Briggs to the west and Peck to the east. Beckwith Road provides direct access onto the project site onto Telegraph Road and Faulkner Road. The following provides a brief description of the streets adjacent to the project site and those providing regional access to the site:

- Harvard Boulevard – Harvard Boulevard, classified as an Arterial, is an east-west street extending from Peck Road to the east where it joins with Telegraph. Harvard Boulevard lies east of the project site and is a four-lane road divided by a two-way left-turn lane. On-street parking is generally allowed on both sides of the street and the speed limit is 35 miles per hour (mph).
- Telegraph Road/Main Street – Telegraph Road, classified as an Arterial, is an east-west street extending westward from Peck Road. Telegraph Road lies north of the project site and is a two-lane road divided by a single dashed yellow line. On-street parking is available on both sides of the street and the speed limit ranges from 35 to 50 mph. East of Harvard Boulevard, the roadway is named Main Street. Main Street continues as a two-lane road divided with either a single dashed yellow line or a double yellow line. On-street parking is generally allowed on both sides of the street, and the speed limit ranges from 25 mph to 35 mph.
- Faulkner Road – Faulkner Road, classified as an Arterial, is an east-west street extending from Peck Road to its current terminus west of the SR-126 Westbound Ramps. Faulkner Road lies south of the project site and is a four-lane road divided by a double yellow line or a two-lane road divided by a double yellow line. On-street parking is not allowed on Faulkner Road, and the speed limit is 25 mph.
- SR-126 (Santa Paula Freeway) – SR-126 is an east-west freeway providing access to Fillmore and Santa Clarita to the east and to Ventura and Oxnard to the west. SR-126 is a four-lane divided freeway west of Hallock Drive with a speed limit of 65 mph. East of Hallock Drive, it is a four-lane highway divided by a two-way left-turn lane with a speed limit of 60 mph.
- Briggs Road – Briggs Road, classified as a Local Street, is a north-south street extending from SR-126 in the south to Foothill Road in the north. Briggs Road lies west of the project site and is a two-lane road divided by a double yellow line. On-street parking is not allowed along Briggs Road, and the speed limit is 25 mph.

- Peck Road – Peck Road, classified as an Arterial, is a north-south street extending from SR-126 in the south to Foothill Road in the north. Peck Road lies east of the project site and is a two-lane road divided by a double yellow line. On-street parking is generally not allowed along Peck Road, and the speed limit is 30 mph.
- Steckel Drive – Steckel Drive, classified as a Collector, is a north-south street extending from SR-126 in the south to Foothill Road in the north. Steckel Drive lies east of the project site and is a two-lane road divided by a double yellow line. On-street parking is generally not allowed along Steckel Drive, and the speed limit is 30 mph.
- Palm Avenue – Palm Avenue, classified as an Arterial, is a north-south street extending from SR-126 in the south to its terminus north of Santa Paula Street. Palm Avenue lies east of the project site and is a two-lane road divided by a double yellow line. On-street parking is generally allowed on both sides of Palm Avenue, and the speed limit is 30 mph.
- 8th Street – 8th Street, classified as a Collector, is a north-south street extending from Santa Maria Street in the south to its terminus north of Santa Paula Street. 8th Street lies east of the project site and is a two-lane road divided by a double yellow line. On-street parking is generally allowed on both sides of 8th Street, and the speed limit is 30 mph.
- 10th Street/Ojai Road (SR-150) – 10th Street (SR-150), classified as a Collector, is a north-south street extending from Santa Maria Street in the south to its terminus north of Vista Point Place. 10th Street lies east of the project site and is a two-lane road divided by a double yellow line or a two-way left-turn lane. On-street parking is generally allowed on both sides of 10th Street, and the speed limit is 30 mph. At the intersection of 10th Street/Ojai Road & Santa Paula Street, SR-150 deviates from 10th Street along Ojai Road. Ojai Road (SR-150) is a north-south highway extending from Santa Paula Street to Meiners Oaks in the north. 10th Street lies east of the project site and is a two-lane street divided by a double yellow line. On-street parking is generally allowed, and the posted speed limit ranges from 30 to 40 mph.
- 12th Street/South Mountain Road – 12th Street, classified as a Collector, is a north-south street extending from Richmond Road in the north to its terminus at Santa Maria Street where it becomes South Mountain Drive. 12th Street lies east of the project site and is a two-lane road divided by a double yellow line. On-street parking is generally allowed on both sides of 12th Street, and the speed limit is 25 mph. South Mountain Drive, classified as an Arterial, is generally an east-west rural road extending from Santa Maria Street in the west towards Fillmore in the east. South Mountain Drive is east of the project site and is a two-lane road divided by a double yellow line. On-street parking is not allowed on South Mountain Drive, and the speed limit is 25 mph.

2.2 EXISTING TRANSIT SERVICE

The Ventura Intercity Service Transit Authority (VISTA) currently provides transit service in the City of Santa Paula. The following is a description of the existing transit service in the City:

- Dial-a-Ride – A demand responsive service with citywide coverage.

- Santa Paula Valley Express – The Valley Express is operates four fixed routes that provide service to the city and schools. The Tripper bus routes and operate twice daily on school days. Route A and B operate throughout the day with headways of 30-40 minutes during the weekday.
- VISTA Highway 126 – This is a commuter-oriented line that provides service between Fillmore and Ventura. During the AM peak, the line primarily travels west into Ventura; during the PM, the line travels to points east of Ventura. The line operates Monday through Friday on approximately 60-minute headways during the peak periods and has limited service on the weekends.

2.3 EXISTING BICYCLE AND PEDESTRIAN FACILITIES

Designated bicycle facilities in the City of Santa Paula are located on Santa Paula Street and along the railroad tracks between Peck Road and 9th Street. There are no existing bicycle facilities on the project site.

2.3.1 Pedestrian Facilities

The project area lacks a complete network of pedestrian facilities around the project site such as sidewalks, crosswalks, and pedestrian safety features. The north side of Telegraph Road and the east side of Beckwith Road provide sidewalks. The proposed project will enhance the pedestrian environment in the development area and along the access routes to the site.

2.4 EXISTING TRAFFIC VOLUMES AND LEVELS OF SERVICE

The following sections present the existing peak hour traffic volumes at each analyzed location, a description of the methodology used to analyze the intersection traffic conditions, and the resulting level of service at each location under existing conditions.

2.4.1 Existing Traffic Volumes

New weekday peak period traffic counts (from 7:00 to 9:00 AM and from 4:00 to 6:00 PM) were collected in late August 2014 for five of the 16 analyzed intersections in this study. For the remaining 11 intersections, traffic counts used in *Transportation Analysis Report for the East Area 1 Specific Plan* (Fehr & Peers, May 2014) which were collected in March 2014 were used.

All traffic counts were collected outside of weeks with major holidays and are provided in Appendix B. The peak hour volumes are shown in Figure 3 and were used to determine the existing (2014) weekday AM and PM peak hour intersection levels of service.

2.4.2 Level of Service Methodology

Level of service (LOS) is a qualitative measure used to describe the condition of traffic flow ranging from excellent conditions at LOS A to overloaded conditions at LOS F. Tables 1 and 2 provide level of service definitions for signalized and unsignalized intersections, respectively. Table 3 provides the level of service definitions for freeways.

NOT TO SCALE

FIGURE 3
EXISTING PEAK HOUR TRAFFIC VOLUMES

TABLE 1
LEVEL OF SERVICE DEFINITIONS FOR SIGNALIZED INTERSECTIONS

Level of Service	Volume/Capacity Ratio	Definition
A	0.000 - 0.600	EXCELLENT. No vehicle waits longer than one red light and no approach phase is fully used.
B	>0.600 - 0.700	VERY GOOD. An occasional approach phase is fully utilized; many drivers begin to feel somewhat what restricted within groups of vehicles.
C	>0.700 - 0.800	GOOD. Occasionally drivers may have to wait through more than one red light; backups may develop behind turning vehicles.
D	>0.800 - 0.900	FAIR. Delays may be substantial during portions of the rush hours, but enough lower volume periods occur to permit clearing of developing lines, preventing excessive backups.
E	>0.900 - 1.000	POOR. Represents the most vehicles intersection approaches can accommodate; may be long lines of waiting vehicles through several signal cycles.
F	> 1.000	FAILURE. Backups from nearby locations or on cross streets may restrict or prevent movement of vehicles out of the intersection approaches. Tremendous delays with continuously increasing queue lengths

A	0-11
B	>11-18
C	>18-26
D	>26-35
E	>35-45
F	>45

Note:

* pc/mi/ln denotes passenger cars per mile per lane

Source: *Highway Capacity Manual*, Exhibit 23-3, Transportation Research Board, 2000.

Consistent with the City's practices, the Intersection Capacity Utilization (ICU) method of intersection analysis was used to determine the intersection volume-to-capacity (V/C) ratio and corresponding level of service for the turning movements and intersection characteristics at the signalized intersections. Based on the calculation methodology described in *2009 Ventura County Congestion Management Program* (VCCMP) (Ventura County Transportation Commission, 2009), the lane capacity at signalized intersections is assumed to be 1,600 vehicles per lane per hour. Nine of the analyzed intersections are currently controlled by traffic signals.

Highway Capacity Manual (HCM) methodologies were used for analysis of the stop-controlled intersections, where controlled vehicular delay in seconds is reported rather than the V/C ratio. Seven of the analyzed intersections are currently stop-controlled.

The freeway methodology as described in the HCM was used to determine the vehicular density on each analyzed segment (passenger cars per mile per lane) by direction and the corresponding level of service.

The Circulation Element of the City of Santa Paula General Plan defines LOS C as the minimum desirable level of service for intersection operations. The VCCMP indicates that LOS E is the minimum desirable level of service across the CMP roadway network.

2.4.3 Existing Intersection Level of Service

Table 4 summarizes the existing weekday AM and PM peak hour LOS at the 16 analyzed intersections. The detailed LOS calculation worksheets are presented in Appendix C. Of the nine signalized intersections, all currently operate at LOS C or better during both the AM and PM peak hours. Of the seven stop-controlled intersections, all but one currently operate at LOS C or better during both the AM and PM peak hours. The exception is Peck Road and SR-126 Eastbound On-/Off-Ramps (Intersection 10), which operates at LOS D in the PM peak hour.

2.4.4 Existing Freeway Analysis

Table 5 summarizes the results of the freeway and multilane highway analysis. As shown in Table 5, all of the freeway segments currently operate at LOS C or better in both directions during both peak hours.

CHAPTER 3. FUTURE (2031) TRAFFIC PROJECTIONS

3.1 PROJECT TRAFFIC VOLUMES

Development of the traffic generation estimates for the proposed project involved a three-step process including traffic generation, trip distribution, and traffic assignment.

3.1.1 Project Traffic Generation

Trip generation rates and equations from *Trip Generation, 9th Edition* (Institute of Transportation Engineers [ITE], 2012) were used to develop trip generation estimates for the proposed project. The trip generation estimates for each proposed land use are summarized in Table 6.

Pass-by credits were not taken for the project's commercial components. Pass-by credits account for trips that would have been passing by the project site regardless of the project, primarily along SR-126 or Telegraph Road, and would therefore not contribute to external project traffic impacts. These credits were not applied in this analysis to ensure traffic generation was not underestimated, resulting in inadequate future roadway capacities.

Transit trip reduction credits were also not applied to any of the proposed uses on the project site because of the limited public transit options available in the area.

As summarized in Table 6, the proposed project is estimated to generate approximately 5,546 daily trips on weekdays, with approximately 646 trips during the weekday AM peak hour and 732 trips during the weekday PM peak hour. These trips formed the basis of the traffic impact analysis.

3.1.2 Project Traffic Distribution

The geographic distribution of traffic generated by the proposed project depends on several factors, including the nature of the proposed land uses, the location of site access points in relation to the surrounding street system, the geographic distribution of existing and future population centers, existing travel patterns, and topographic constraints.

The estimated distribution of trips generated by the proposed project was based on the location of the project site in the City and Santa Paula region, and was informed by the studies of previous projects in the area. Following consultation with City staff, the trip distribution pattern illustrated in Figure 4 and described below was used in this analysis:

- 60% local trips within town
- 3% to/from the north
- 2% to/from the south
- 10% to/from the east
- 25% to/from the west

FIGURE 4

[a] Source: *Trip Generation, 9th Edition* (ITE, 2012).

3.1.3 Project Traffic Assignment

The trip generation estimates presented in Table 6 and the distribution pattern illustrated in Figure 4 were used to assign the project-generated traffic to the local and regional roadway system. Figure 5 illustrates the estimated project-generated peak hour traffic volumes at each of the analyzed intersections during typical weekday AM and PM peak hours.

3.2 EXISTING PLUS PROJECT TRAFFIC PROJECTIONS

The proposed project traffic volumes were then added to the existing traffic volumes to develop the existing plus project traffic forecasts. Figure 6 illustrates the resulting projected existing plus project peak hour traffic volumes for a typical weekday AM and PM peak hour.

3.3 CUMULATIVE BASE (YEAR 2031) TRAFFIC PROJECTIONS

The cumulative base traffic projections normally reflect changes to existing traffic conditions that can be expected from two sources. The first source is the ambient growth in traffic, which reflects increases in traffic due to regional growth and development. The second source is traffic generated by specific development located within, or in the vicinity of, the study area. These projected traffic volumes represent cumulative base conditions.

3.3.1 Related Projects Traffic Generation and Assignment

Information on cumulative projects was obtained from the City of Santa Paula Planning Department. These developments are assumed to be in place by year 2031 and are included in the forecasts. For reference, the locations of the cumulative projects are illustrated in Figure 7 and trip generation estimates were prepared for the cumulative projects in the City using standard trip generation rates from *Trip Generation, 9th Edition* (Institute of Transportation Engineers [ITE], 2012). The list of cumulative projects and trip generation estimates are shown in Table 7. The cumulative projects are estimated to add approximately 4,509 AM peak hour trips and 5,235 PM peak hour trips.

3.3.2 Background or Ambient Growth

To develop the ambient growth rate for Santa Paula for 2031, the 2012 Southern California Association of Governments (SCAG) Regional Transportation Plan (RTP) Travel Demand Model was used. The SCAG model is maintained SCAG and is reviewed by local agencies throughout the SCAG region. Land use projections for the City in that model were compared with projections in the countywide model maintained by the Ventura County Transportation Commission and found to be more conservative. A review of forecast traffic volume growth on roadways within the City indicated an ambient growth rate of approximately 0.5%/year, or 8.5% over the 17-year planning horizon for this study. This growth was applied to the existing baseline traffic volumes to reflect the effects of regional growth through 2031. The projected traffic volumes representing the cumulative base conditions (Year 2031) without the project are shown in Figure 8.

Related project data obtained from the City of Santa Paula in December 2013.

3.4 TRANSPORTATION SYSTEM IMPROVEMENTS

Physical street system improvements expected to be implemented by 2031 in the study area were included in the analysis of cumulative base conditions. Information about these expected improvements was provided by City staff in 2014.

On-street bicycle lanes will be added to 10th Street from Santa Paula Street to Harvard Boulevard possibly extending to SR-126. The City has selected a consultant to design landscape and streetscape improvements along this corridor, which include the removal of on-street parking at some locations to accommodate the planned bicycle lanes. While no plans are yet available for these improvements, this study assumes that the existing lane configurations at each of the analyzed intersections along 10th Street will be maintained.

3.5 CUMULATIVE PLUS PROJECT (YEAR 2031) TRAFFIC PROJECTIONS

The proposed project traffic volumes were then added to the cumulative base traffic projections to develop the cumulative plus project traffic forecasts. Figure 9 illustrates the resulting projected cumulative plus project peak hour traffic volumes for a typical weekday AM and PM peak hour, representing future traffic conditions following completion of the proposed project with the Beckwith Road extension.

FIGURE 9
CUMULATIVE PLUS PROJECT PEAK HOUR TRAFFIC VOLUMES

CHAPTER 4. TRAFFIC IMPACT ANALYSIS

This section presents an analysis of the projected future volumes to determine the potential impacts of the proposed project on the operating conditions of the surrounding street system.

4.1 SIGNIFICANT IMPACT CRITERIA

As adopted in the City of Santa Paula General Plan Circulation Element (1998), the minimum acceptable level of service at intersections in the City is LOS C. An intersection operating at LOS D or worse under the cumulative base conditions is considered a cumulatively impacted intersection. An intersection projected to operate at LOS D or worse after the addition of project traffic is considered significantly impacted by the project. Therefore, any contribution resulting in operating conditions of LOS D or worse is considered a significant impact.

The minimum desirable level of service on the analyzed freeway segments is LOS E, as described in the VCCMP. If the addition of project traffic were to cause or significantly worsen LOS F, it would be considered a significant impact. Although the VCTC has adopted LOS E as a minimum system-wide level of service on all VCCMP roadways it does not provide specific criteria regarding when an individual project's impact may be deemed significant. Therefore, for the purpose of this analysis, the significance threshold from *2010 Los Angeles Congestion Management Program (CMP) for Los Angeles County* (Los Angeles County Metropolitan Transportation Authority, 2010) was used. The Los Angeles County CMP states that a project impact would be considered significant if the facility were projected to operate at LOS F after the addition of project traffic, and if the project causes a net increase in traffic demand of 2% of capacity or more (i.e., V/C ratio increase greater than or equal to 0.02).

4.2 EXISTING PLUS PROJECT OPERATING CONDITIONS

The resulting existing plus project peak hour traffic volumes, illustrated in Figure 6, were analyzed to determine the projected operating conditions following completion of the proposed project. The results of the analysis are summarized in Table 8.

A total of 12 intersections are projected to operate at LOS C or better during both AM and PM peak hours. The four intersections listed below are projected to operate at LOS D or worse during one or both peak hours.

1. 10th Street & Harvard Boulevard (LOS D AM)
8. Peck Road & Harvard Boulevard/Telegraph Road/Main Street (LOS D AM)
10. Peck Road & SR-126 Eastbound On-/Off-Ramps (LOS E PM)
12. Beckwith Road & Telegraph Road (LOS D PM)

Because the City of Santa Paula has defined the minimum desirable intersection level of service as LOS C, traffic generated by the proposed project would cause or contribute to significant traffic impacts at each of these four intersections. All of the impacted intersections have project-specific impacts (impacts directly related to the addition of project traffic).

Note:

[a] Intersection is controlled by stop signs. Average vehicular delay in seconds is reported rather than V/C ratio.

The project-related traffic added to these intersections during the peak hours would contribute to a projected decline below LOS C operation under existing plus project conditions.

The 10 directional freeway segments are projected to operate at LOS C or better during both peak hours under the existing plus project scenario, as summarized in Table 9.

4.3 CUMULATIVE BASE (YEAR 2031) OPERATING CONDITIONS

The cumulative base (Year 2031) without project traffic volumes shown in Figure 8 were analyzed using the LOS methodologies described in Chapter 2 to evaluate future levels of service at the study intersections for the weekday AM and PM peak hours. This analysis assumed completion of the related projects described in Chapter 3 as well as regional traffic growth as estimated by the SCAG's travel demand model. The results of the intersection analysis are summarized in Table 10. The freeway segment analysis is presented in Table 11. Detailed LOS calculation worksheets are presented in Appendix C.

Of the 16 intersections selected for analysis, 12 intersections are projected to operate at LOS C or better during both AM and PM peak hours under cumulative base conditions. Four intersections are projected to operate at LOS D or worse during one or both peak hours:

1. 10th Street & Harvard Boulevard (LOS E AM and LOS F PM)
8. Peck Road & Harvard Boulevard/Telegraph Road/Main Street (LOS E AM)
10. Peck Road & SR-126 Eastbound On-/Off-Ramps (LOS F PM)
11. Faulkner Road & SR-126 Westbound On-/Off-Ramps (LOS F AM)

As defined by the City of Santa Paula, the minimum desirable intersection level of service is LOS C. The four study intersections listed above are projected to operate at undesirable levels of service in one or both peak hours under cumulative base conditions, without the addition of project-related traffic. Therefore, these intersections would be significantly impacted due to cumulative development and are noted as such in Table 10.

Notes:

* pc/mi/ln denotes passenger cars per mile per lane

[a] Analyzed using freeway methodology from *Highway Capacity Manual* .

Of the 10 directional freeway segments selected for analysis, all are projected to operate at LOS E or better during both the AM and PM peak hours under cumulative base conditions. As defined in the VCCMP, the minimum desirable level of service on freeway segments is LOS E. Therefore, no freeway segments would be significantly impacted due to cumulative development.

4.4 CUMULATIVE PLUS PROJECT (YEAR 2031) TRAFFIC CONDITIONS

The resulting cumulative plus project peak hour traffic volumes, illustrated in Figure 9, were analyzed to determine the projected future 2031 operating conditions following completion of the proposed project. The results of the analysis are summarized in Table 10.

A total of 11 intersections are projected to operate at LOS C or better during both AM and PM peak hours. The five intersections listed below are projected to operate at LOS D or worse during one or both peak hours.

1. 10th Street & Harvard Boulevard (LOS F AM and PM)
8. Peck Road & Harvard Boulevard/Telegraph Road/Main Street (LOS F AM and LOS D PM)
10. Peck Road & SR-126 Eastbound On-/Off-Ramps (LOS F PM)
11. Faulkner Road & SR-126 Westbound On-/Off-Ramps (LOS F AM)
12. Beckwith Road & Telegraph Road (LOS E PM)

As defined by the City of Santa Paula's definition of minimum desirable intersection level of service (LOS C), traffic generated by the proposed project would cause or contribute to significant traffic impacts at each of these intersections. Of the five impacted intersections, project-specific impacts (impacts directly related to the addition of project traffic) are identified at the following intersection:

12. Beckwith Road & Telegraph Road (LOS F PM)

The project related traffic added to this intersection during the PM peak hour would contribute to a projected decline below LOS C operation under cumulative plus project conditions. The addition of project-related traffic to the other impacted intersections would contribute to the projected undesirable levels of service.

Of the 10 analyzed directional freeway segments, all are projected to operate at LOS E or better in both directions and in both peak hours, thereby meeting the minimum desirable level of service.

Although the VCTC has adopted LOS E as a minimum system-wide level of service on all VCCMP roadways it does not provide specific criteria regarding when an individual project's impact may be deemed significant, nor does it have a funding mechanism in place for individual projects to contribute toward future improvements. Therefore, for the purpose of this analysis, the significance threshold from *2010 Los Angeles Congestion Management Program (CMP) for Los Angeles County* was used. The Los Angeles County CMP states that a project impact would be considered significant if the facility were projected to

operate at LOS F after the addition project traffic and if the project causes a net increase in traffic demand of 2% of capacity or more (i.e., V/C ratio increase greater than or equal to 0.02).

No project-related impact was identified. It is noted that the VCCMP indicates that VCTC may request that Caltrans initiate a Corridor System Management Plan (CSMP) for the entire SR-126 corridor within Ventura County, which would examine multi-modal solutions for reducing congestion along the corridor.

4.5 MITIGATION MEASURES

Mitigation measures were developed to alleviate the impacts under both the existing plus project scenario and the cumulative plus project scenario. Recommended mitigation measures include both operational and physical improvements. Tables 12 through 14 present summaries of the LOS analysis results with these mitigation measures in place.

4.5.1 Existing plus Project Mitigation Measures

Intersection Improvements

At the four intersections projected to operate at LOS D or worse, the recommended mitigation measures would fully mitigate all but one of the identified existing undesirable LOS and project impacts, as shown in Table 12. The lane configuration diagrams in Appendix A illustrate the proposed mitigation measures at the impacted intersections. The following provides a description of the proposed improvements:

- 10th Street & Harvard Boulevard (Intersection 1) – Mitigation measures from prior major projects in Santa Paula were investigated along the Ojai Road corridor. A beautification project including bicycle lanes is planned along 10th Street at this location; therefore, widening of 10th Street to gain capacity was not considered as a possible mitigation. Given the constraints of the intersection and the proposed bicycle lanes, this intersection cannot be fully mitigated; thus, the impact would remain **significant and unavoidable**. Alternatively, a peak parking restriction on the southbound approach would allow for the reconfiguration of the southbound approach to include on shared through/right turn lane, one through lane (during peak hours), and on left-turn lane. The northbound approach could be restriped to provide one right-turn lane, one through lane, and one left-turn lane. In combination, these measures would result in an improvement from LOS C during the AM peak hour and LOS D during the PM peak hour to LOS A during the AM peak hour and LOS B under the PM peak hour, thus mitigating the increase in V/C ratio attributable to project traffic. However, due to the planned bicycle lanes, these mitigations were not considered as a feasible mitigation.
- Peck Road & Main Street and Harvard Boulevard (Intersection 8) – This intersection could be mitigated to LOS C or better with the addition of one travel lane to both the northbound and southbound approaches on Peck Road and the addition of a northbound right overlap phase. The northbound lane configuration would be one right-turn lane, two through lanes, and one left-turn lane. The northbound right-turn movement would also have an overlap signal head installed to accommodate the overlap phase. The southbound lane configuration would be one shared through/right-turn lane, one through lane, and one left-turn lane.

- Peck Road & SR-126 Eastbound On-/Off-Ramps (Intersection 10) – This intersection can be mitigated to LOS C or better by installing a traffic signal. A peak hour signal warrant analysis is provided in Appendix D and indicates that the installation of a traffic signal would be warranted under existing plus project conditions during the PM peak hour.¹
- Beckwith Road & Telegraph Road (Intersection 12) – This intersection could be mitigated to LOS C or better by installing a traffic signal and reconfiguring the westbound approach. A peak hour signal warrant analysis is provided in Appendix E and indicates that the installation of a traffic signal would be warranted under existing plus project conditions. The westbound approach can be restriped to provide one right-turn lane, one through lane, and one left-turn lane (a reconfiguration of the existing two-way left-turn lane). With the development of the Santa Paula West Business Park, Beckwith Road will be widened to full City standards, which provide for a 64-foot roadway within an 84-foot right-of-way. With the additional roadway width, the northbound approach could be widened from its current single-lane configuration to provide one left-turn lane and one shared through/right-turn lane. With this configuration as mitigation, the intersection would operate at LOS C or better under existing plus project conditions.

Freeway Improvements

No freeway mitigation measures are needed because the project would not result in significant impacts based on the CMP criteria.

4.5.2 Cumulative plus Project Mitigation Measures

Intersection Improvements

At the five intersections projected to operate at LOS D or worse, the recommended mitigation measures would fully mitigate all but two of the intersections identified with cumulative and project impacts, as shown in Table 13. The lane configuration diagrams in Appendix A illustrate the proposed mitigation measures at the impacted intersections. The following provides a description of the proposed improvements:

- 10th Street & Harvard Boulevard (Intersection 1) –The constraints of the intersection and the proposed bicycle lanes discussed under Existing plus Project scenario would also apply to the Cumulative plus Project scenario. Therefore, this intersection cannot be fully mitigated; thus, the impact would remain **significant and unavoidable**. The alternative proposed mitigation mentioned previously under Existing plus Project would result in an improvement from LOS F during the AM peak and PM peak hours to LOS C during the AM peak hour and LOS E under the PM peak hour, thus mitigating the increase in V/C ratio attributable to project traffic. However, due to the planned bicycle lanes, these mitigations were not considered as a feasible mitigation.

¹ Ibid.

- Peck Road & Harvard Boulevard/Telegraph Road/Main Street (Intersection 8) – This intersection could be mitigated to LOS D with the same mitigation measure suggested for the Existing plus Project scenario. Full mitigation of this intersection under Cumulative plus Project conditions requires the addition of a second left-turn lane to the westbound approach on Main Street. The westbound approach on Main Street would have to be reconfigured to include one right-turn lane and dual left-turn lanes and maintain the exclusive or protected signal phasing for this turning movement. However, the implementation of dual left-turns at this location would require the acquisition of right-of-way on Main Street and relocation of existing grade crossing gates to accommodate the proposed intersection configuration, and so was not considered as a feasible mitigation. Given the constraints of the intersection, this intersection cannot be fully mitigated; thus, the impact would remain **significant and unavoidable**.
- Peck Road & SR-126 Eastbound On-/Off-Ramps (Intersection 10) – This intersection could be mitigated to LOS C or better by installing a traffic signal and reconfiguring all approaches. A peak hour signal warrant analysis is provided in Appendix E and indicates that the installation of a traffic signal would be warranted under cumulative plus project conditions. The northbound approach can be restriped to provide one shared through/right-turn lane and one left-turn lane. The southbound approach would require widening within Caltrans' existing right-of-way to provide one right-turn lane, one through lane, and one left-turn lane. The eastbound and westbound approaches can be restriped to provide one shared through/right-turn lane and one left-turn lane each. This improvement would require coordination with and approval by Caltrans.
- Faulkner Road & SR-126 Westbound On-/Off-Ramps (Intersection 11) – This intersection could be mitigated to LOS C or better by reconfiguring the westbound approach. The westbound approach can be restriped to provide one shared through/right-turn lane and two left-turn lanes. While the freeway on-ramp at this location currently provides two lanes, this improvement would require coordination with and approval by Caltrans.
- Beckwith Road & Telegraph Road (Intersection 12) – This intersection could be also mitigated to LOS C under cumulative plus project conditions with the same mitigation measure suggested for the existing plus project conditions.

Freeway Improvements

No freeway mitigation measures are needed because the project would not result in significant impacts based on the CMP criteria.

4.6 MITIGATION FUNDING

Fair-share calculations for developer contributions were made for the intersections impacted by project generated traffic. The calculations were developed by calculating the increase in total projected traffic volumes at each intersection from the existing conditions to the cumulative plus project conditions; the increase establishes the total amount of projected growth at each location. Next, the project-only volumes are divided by the total volume increase at each impacted intersection. This step determines the amount of traffic the project is contributing to the intersection and the approximate proportional contribution towards funding the proposed mitigation measure.

The fair-share calculations were performed for both AM and PM peak hours, as shown in Table 14. The range of maximum contribution is between 13.3% and 55.1%. At one location, the calculated maximum fair share does not accurately reflect the cause of the impacts at the intersection. Based on the intersections analysis, the impacts at one intersection is a project-related impact (rather than cumulative impacts to which the project would contribute):

12. Beckwith Road & Telegraph Road

As a project-related impact, 100% contribution is identified for this intersection.

11.	Faulkner Road & SR-126 WB On-/Off-Ramps	731	1,310	319	579	55.1%	[b]	[b]	[b]	[b]	[b]	55.1%
12.	Beckwith Road & Telegraph Road	[b]	[b]	[b]	[b]	[b]	728	1,199	368	471	78.1%	100% [a]

Notes:

- [a] Based on Table 11, the impact at this intersection is only attributed to the project. Therefore, the maximum contribution is recommended for this intersection.
- [b] Because no project impact was identified in this peak hour, no fair-share contribution was calculated.

CHAPTER 5. WITHOUT BECKWITH EXTENSION ANALYSIS

Another future scenario considers impacts on the roadway network that would occur if Beckwith Road were not extended to Faulkner Road. This scenario would not require a new at-grade crossing, for which the regulatory approvals have not yet been granted. Figure 1 illustrates the approximate location of the Beckwith Road extension. The full development of the uses permitted by the Santa Paula West Business Park Specific Plan project was assumed in this scenario, as described earlier in this report. The number and location of analyzed intersections and roadway segments is identical to what was analyzed for the cumulative base plus project conditions with Beckwith Road extension.

5.1 WITHOUT BECKWITH ROAD EXTENSION TRAFFIC PROJECTION

The trip generation estimates presented in Table 6 and the distribution pattern illustrated in Figure 4 were used to assign the project-generated traffic to the local and regional street system. Figure 10 illustrates the estimated project-only volumes without the Beckwith Road extension traffic volumes at each of the analyzed intersections during typical weekday AM and PM peak hours. The project-only volumes differ from those displayed in Figure 5 due to the lack of the Beckwith Road extension. The trip generation estimates presented in Table 6 and the distribution pattern illustrated in Figure 4 were used to assign the project-generated traffic to the local and regional street system.

5.2 EXISTING PLUS PROJECT WITHOUT BECKWITH ROAD EXTENSION TRAFFIC CONDITIONS

Figure 11 illustrates the estimated existing plus project-generated peak hour traffic volumes at each of the analyzed intersections during typical weekday AM and PM peak hours without the Beckwith Road extension. The project-only volumes differ somewhat slightly from those displayed in Figure 5 due to the lack of the Beckwith Road extension.

These volumes were analyzed to determine the projected existing plus project operating conditions under this scenario. The results of the intersection analysis are summarized in Table 15. The freeway segment analysis is presented in Table 16.

A total of 13 intersections are projected to operate at LOS C or better during both AM and PM peak hours. The three intersections listed below are projected to operate at LOS D or worse during one or both peak hours.

8. Peck Road & Harvard Boulevard/Telegraph Road/Main Street (LOS D AM)
10. Peck Road & SR-126 Eastbound On-/Off-Ramps (LOS E PM)
12. Beckwith Road & Telegraph Road (LOS D PM)

Notes:

* pc/mi/ln denotes passenger cars per mile per lane

[a] Analyzed using freeway methodology from *Highway Capacity Manual*.

Because the City of Santa Paula has defined the minimum desirable intersection level of service as LOS C, traffic generated by the proposed project would cause or contribute to significant traffic impacts at each of these three intersections. With the exception of Peck Road and SR-126 Eastbound On-/Off-Ramps intersection because the existing has an LOS D in the PM peak hour, all of the impacted intersections have project-specific impacts (impacts directly related to the addition of project traffic).

The freeway LOS results for this scenario are consistent with those in the previous chapter.

One intersection impact (10th Street & Harvard Boulevard) would be removed under existing plus project conditions in the scenario without the roadway link. Significant impacts are identified at the same three other intersections under this scenario.

5.3 CUMULATIVE PLUS PROJECT WITHOUT BECKWITH ROAD EXTENSION TRAFFIC CONDITIONS

Figure 12 illustrates the estimated future project-generated peak hour traffic volumes at each of the analyzed intersections during typical weekday AM and PM peak hours without the Beckwith Road extension. The project-only volumes differ from those displayed in Figure 9 due to the lack of the Beckwith Road extension.

These volumes were analyzed to determine the projected future operating conditions under this scenario. The results of the intersection analysis are summarized in Table 17. The freeway segment analysis is presented in Table 18.

A total of 11 intersections are projected to operate at LOS C or better during both AM and PM peak hours. The five intersections listed below are projected to operate at LOS D or worse during one or both peak hours.

1. 10th Street & Harvard Boulevard (LOS F AM and PM)
8. Peck Road & Harvard Boulevard/Telegraph Road/Main Street (LOS F AM and LOS D PM)
10. Peck Road & SR-126 Eastbound On-/Off-Ramps (LOS F PM)
11. Faulkner Road & SR-126 Westbound On-/Off-Ramps (LOS F AM)
12. Beckwith Road & Telegraph Road (LOS E PM)

As defined by the City of Santa Paula's definition of minimum desirable intersection level of service (LOS C), traffic generated by the proposed project would cause or contribute to significant traffic impacts at each of these intersections. Of the five impacted intersections, project-specific impacts (impacts directly related to the addition of project traffic) are identified at one intersection: 12. Beckwith Road & Telegraph Road (LOS E PM).

Notes:

* pc/mi/ln denotes passenger cars per mile per lane

[a] Analyzed using freeway methodology from *Highway Capacity Manual*.

The project related traffic added to this intersection during the PM peak hour would contribute to a projected decline below LOS C operation under cumulative plus project conditions. The addition of project-related traffic to the other impacted intersections would contribute to the projected undesirable levels of service.

The freeway LOS results for this scenario are consistent with those in the previous chapter.

5.4 MITIGATION MEASURES

For the Existing plus Project Scenario without the Beckwith Road extension, the mitigation measures discussed in Chapter 4 for the three significantly impacted intersections would mitigate all intersection impacts, as shown in Table 19.

For the Cumulative plus Project Scenario without the Beckwith Road extension, the mitigation measures discussed in Chapter 4 for these significantly impacted intersections would mitigate all but two intersection impacts, as shown in Table 20. The two remaining intersection impacts are at 10th Street & Harvard Boulevard and Peck Road and Harvard Boulevard/Telegraph Road/Main Street. These impacts would remain **significant and unavoidable** for the Cumulative plus Project Scenario without the Beckwith Road extension due to the same constraints identified previously in Section 4.5.

5.4.1 Mitigation Funding

Fair-share calculations for developer contributions were made for the intersections impacted by project generated traffic. The calculations were developed by calculating the increase in projected traffic volumes from the existing condition to the cumulative plus project condition; the increase establishes the total amount of projected growth at each location. Next, the project-only volumes are divided by the total volume increase at each impacted intersection. This step determines the amount of traffic the project is contributing to the intersection and the approximate proportional contribution towards funding the proposed mitigation measure.

The fair share calculations were performed for both the AM and PM peak hours, as shown in Table 21. The range of maximum project contribution is between 11.3% and 56.6%. At one location, the calculated maximum fair share does not accurately reflect the cause of the impacts at the intersections. Based on the intersection analysis, the impacts at the following intersections are project-related impacts (rather than cumulative impacts to which the project would contribute):

12. Beckwith Road & Telegraph Road

As projected-related impacts, a 100% contribution is identified for this location.

Note:

[a] Intersection is controlled by stop signs. Average vehicular delay in seconds is reported rather than V/C ratio.

**TABLE 21
FUTURE (YEAR 2031) PROJECT FAIR SHARE TRAFFIC CONTRIBUTION - WITHOUT BECKWITH EXTENSION**

Int #	Intersection	AM Peak Hour					PM Peak Hour					Maximum Contribution
		Existing Traffic	2031 Projected Traffic	Project Only Traffic	Total New Traffic	Project % of New Traffic	Existing Traffic	2031 Projected Traffic	Project Only Traffic	Total New Traffic	Project % of New Traffic	
1.	10th Street & Harvard Boulevard	2,054	2,791	83	737	11.3%	2,232	3,105	93	873	10.7%	11.3%
8.	Peck Road & Harvard Boulevard/Telegraph Road/Main St	1,959	3,223	477	1,264	37.7%	1,935	3,231	470	1,296	36.3%	37.7%
10.	Peck Road & SR-126 EB On-/Off-Ramps/ Acacia Way	[b]	[b]	[b]	[b]	[b]	974	1,529	198	555	35.7%	35.7%
11.	Faulkner Road & SR-126 WB On-/Off-Ramps	731	1,330	339	599	56.6%	[b]	[b]	[b]	[b]	[b]	56.6%
12.	Beckwith Road & Telegraph Road	[b]	[b]	[b]	[b]	[b]	728	1,215	384	487	78.9%	100% [a]

Notes:

- [a] Based on Table 18, the impact at this intersection is only attributed to the project. Therefore, the maximum contribution is recommended for this intersection.
- [b] Because no project impact was identified in this peak hour, no fair-share contribution was calculated.

2031 Plus Project Mitigation AM

Level Of Service Computation Report
2000 HCM 4-Way Stop Method (Base Volume Alternative)

Intersection #11 Faulkner Road & SR-126 WB On/Off-Ramps

Cycle (sec): 100 Critical Vol./Cap.(X): 0.599
Loss Time (sec): 0 (Y+R=4.0 sec) Average Delay (sec/veh): 15.1
Optimal Cycle: 0 Level Of Service: C

Table with columns for Street Name, Approach, Movement, Control, Rights, Min. Green, and Lanes. Rows include Faulkner Road (North/South Bound) and SR-126 WB On/Off-Ramps (East/West Bound).

Volume Module:

Table showing traffic volume metrics: Base Vol, Growth Adj, Initial Bse, User Adj, PHF Adj, PHF Volume, Reduct Vol, Reduced Vol, PCE Adj, MLF Adj, and Final Volume.

Saturation Flow Module:

Table showing saturation flow metrics: Adjustment, Lanes, and Final Sat.

Capacity Analysis Module:

Table showing capacity analysis metrics: Vol/Sat, Crit Moves, Delay/Veh, Delay Adj, AdjDel/Veh, LOS by Move, ApproachDel, Delay Adj, ApprAdjDel, LOS by Appr, and AllWayAvgQ.

Note: Queue reported is the number of cars per lane.

**APPENDIX E:
TRAFFIC SIGNAL WARRANTS**

EXISTING PLUS PROJECT WITH MITIGATION

SUMMARY OF TRAFFIC SIGNAL WARRANT ANALYSIS

Major Street: SR-126 EB On/Off-Ramps
 Minor Street: Peck Road
 Scenario: Existing Plus Project

SUMMARY OF RESULTS

Warrant	MUTCD Warrant Number	Caltrans Warrant Number	Requested for Analysis?	Volumes Satisfy Warrant?	Applicable Time Period
Eight Hour Vehicular Volume	1				
Minimum Vehicular Volume	1A	1	YES	YES	8th Highest Hour
Interruption of Continuous Traffic	1B	2	YES	NO	8th Highest Hour
80% Combination	1C	8	YES	NO	8th Highest Hour
Four Hour Volume	2	9	YES	YES	4th Highest Hour
Peak Hour Volume	3	11	YES	YES	Peak Hour
Estimated Average Daily Traffic	n/a	n/a			
Minimum Vehicular Volume			NO	n/a	Daily
Interruption of Continuous Traffic			NO	n/a	Daily
80% Combination			NO	n/a	Daily

SUMMARY OF TRAFFIC SIGNAL WARRANT ANALYSIS

Major Street: Telegraph Road
 Minor Street: Beckwith Road

Introduction

The Santa Paula West project is a planned commercial and industrial development containing a mixture of industrial, research and development, retail, office and commercial uses. The Specific Plan project site is located just outside the limits, but within the sphere of influence, of the City of Santa Paula. The land use to the west and to the south is agriculture. Highway 126 runs along the south edge of the specific plan area, and to the east is existing industrial and commercial development. To the north is Telegraph Road and residential development. The Regional Location Map is shown below as Figure 1.

FIGURE 1 - REGIONAL LOCATION MAP

Access to the site is provided by Beckwith Road, Telegraph Road, and Faulkner Road. Figure 2 shows the project location.

FIGURE 2 – PROJECT LOCATION MAP

Existing Conditions

The Santa Paula West Project lies within the City of Santa Paula for domestic water services. Even though the existing land use is mainly agricultural in nature, systems of water mains exist in the streets surrounding the project, Faulkner Road and Telegraph Road. All of the City's water supply comes from 5 existing wells that pump from the Santa Paula Groundwater Basin that is recharged by Santa Clara River, Santa Paula Creek, and other local streams. This water supply is either treated at the Steckel Conditioning Facility or has the capacity to remove iron and manganese at the well site. The domestic water system in Telegraph Road is a 10" ACP line and a 12" PVC line is located at the end Faulkner Road at Todd Lane. This portion of the existing City system will service the specific plan area. These domestic water systems have sufficient quantities of water necessary for the Santa Paula West Business Park development for domestic and fire requirements. A flow test was completed by WREA on June 25, 2009 to verify pressures within the existing system. These flow tests were used for the water system analysis in this report.

The City of Santa Paula commissioned a domestic water study for reviewing the City's entire water system, both domestic and recycled. This study, "Potable Water System Master Plan" prepared by Boyle Engineering, was subsequently completed in October 2005 with an amendment in 2012. The "Potable Water System Master Plan" identifies Santa Paula Business Park (Santa Paula West 2) as a future expansion area. It projected an area of 60.75 acres of commercial development. The Specific Plan for the Santa Paula West project shows 53.81 acres of Industrial business park (See Figure 5A). Once annexed, Santa Paula Business Park (Santa Paula West 2) will be within the City's sphere of influence and anticipates demand from the Santa Paula West project as well as other notable projects in and around the City of Santa Paula.

Objectives

The objective of this study is to provide a blueprint for the design of a single zone scenario domestic water system within the Santa Paula West Business Park. The Santa Paula West project will be designed to meet or exceed the City of Santa Paula's domestic water design criterion as established in the "Potable Water System Master Plan". The design guidelines set forth in this report are consistent with those set forth in the City's "Potable Water System Master Plan".

Procedure

The Santa Paula West domestic water system was developed utilizing the following 6 basic design steps:

1. Define Design Parameters

Design parameters for the domestic water system were developed from the City of Santa Paula Potable Water System Master Plan, October 2005, Table 3-10 in Section 3 value of 15 gal/SF/yr has been changed to its equivalent of 2 AF/acre/yr as a more convenient value for use in the exhibits. Fire flow requirements were taken from Table 3-1. The design parameters are also referenced in Figure 3 of this report. A preliminary water layout is shown on Figure 8. The elevations of the waterlines used in the report were taken from elevations shown on Figure 8 with an assumed pipe depth of 5 feet.

2. Define Land Use Types and Locations

Land uses were defined utilizing the Specific Plan for Santa Paula West, specifically Chapter 2 – Land Use and Circulation. The land use types used in this report can be seen in Figure 5. During the tentative map stage, a specific water system model will be developed and processed. The modeling included herein will provide for an upper boundary (most conservative) analysis should the ultimate development proceed.

3. Assign Domestic Water Consumption Factors

Based on the aforementioned design parameters, specific domestic water consumption rates were applied. The domestic water consumption rates are shown in Figure 4. The consumption rates were then logically spread out to junctions (nodes) within the domestic water system and quantities are shown in Figures 6A & 6B.

4. Model Domestic Water System

After each individual junction received a domestic water consumption rate, the resultant water demands were logically linked together in a model. Pipes connecting the various junctions were developed based on potential phasing of the project, demand types and locations, and internal system redundancy. Maximum Day and Peak Hour runs were analyzed for steady state conditions. A fire flow of 4,500 gpm was added to the system along with the Maximum Day Demand (MDD) loading for a

single hydrant (both steady state run and 2-hour extended period run). The results of these models can be seen in Figures 7A, 7B, and 7C. See Figure 8 for pipe and junction locations.

5. Prepare Summary Graphic

After demands were logically linked together in a model a resultant water system graphic was prepared. The results of this model can be seen in Figure 8 Water Layout.

Proposed Domestic Water System

The Santa Paula West Business Park Specific Plan anticipates a looped system for the specific plan area. The main system loop starts at the existing end of Faulkner Road and extends west along Faulkner Road and through the north-south road with dual cul de sacs, Road 'A' and Road 'B', connecting to Telegraph Road. A second backbone system will be located in the north-south through road, Beckwith Road. Beckwith Road's existing 8" ACP line will remain in place. These domestic water lines are 12" and 10" diameter facilities, respectively. Each building will have its own domestic water master meter and fire system connected to the main trunk line and in a location that is within City Right of Way.

Results

The Water System Analysis in Figure 7 shows calculated demands with the resulting steady state pressures and velocities for the 0, 1, 2, 3, and 4 hour extended period run for each fire hydrant and building demands. All water mains within the project were designed so that the Peak Hour and Maximum Day usage had a pressure range above 43 psi (pounds per square inch) and below 150 psi per Table 3-10 in the *City of Santa Paula Potable Water System Master Plan*, October 2005. Since the Potable Water System Master Plan states that the maximum pressure at a residence or other structure is 80 psi and our average pressure at the junctions is 100 psi, it is recommended that pressure reducers are installed at the meter locations to each building. Fire flow pressure at location J-7 is 81 psi which is greater than the required minimum of 20 psi.

Proposed Reclaimed Water System

SANTA PAULA WEST BUSINESS PARK DOMESTIC WATER TECHNICAL REPORT

The proposed Recycled Water Plan is shown on Figure 6B. The Santa Paula West Business Park Specific Plan recycled water system would operate via a proposed 12” distribution main as called for in the City’s Recycled Water Plan. This 12” distribution main will be constructed in Telegraph Road, within the city limits. This terminus becomes the main point of connection (POC) for the Santa Paula West Business Park Specific Plan project. From the POC a new recycled water system will proceed throughout into the Santa Paula West Business Park Specific Plan site. The proposed distribution system will be comprised of 6” mains from the POC of the City’s recycled water system. Anticipated demand for recycled water in the Santa Paula West Business Park Specific Plan project is estimated at 17.9 AFY as shown in table below.

Recycled Water Use Summary Table

Area acres	Percent Landscaped	Annual Use	
		**AF/ac/yr	AF
53.81	15	2.22	17.9

**From "Water Supply Assesment, East Area One Specific Plan" by Impact Science, April 2007

According to the City’s Potable Water System Master Plan, the City will in the future develop a recycled water system conveyance plan that will include a line in Telegraph Road. The project includes an onsite recycled water distribution system to irrigate greenbelt and irrigation areas. This will allow the Santa Paula West Business Park Specific Plan to make use of recycled water when the City completes its planned recycled water plan and extends a line to the point of connection in the railroad right of way at Beckwith Road.

Conclusions

Based on the modeling prepared by Jensen Design & Survey, the Santa Paula West Business Park domestic water system depicted in Figure 8 is in accordance with City of Santa Paula design guidelines for maximum fire flows, peak hour demands, and maximum daily demands. Flow testing for the model was completed on June 25, 2009.

**FIGURE 3
SANTA PAULA WEST
SUMMARY OF DOMESTIC WATER DESIGN CRITERIA**

Average Domestic Water Consumption Rates	
Commercial Uses	2 AF/ac/yr [2]
Industrial Uses	2 AF/ac/yr [2]
Demand Cases	
Studied Cases include the following two design scenarios: PHD & MDD+FF	
Maximum Day Demand (MDD)	MDD = 1.5 x Average Day Demand
Peak Hour Demand (PHD)	PHD = 1.8 x Maximum Day Demand
Fire Flow (FF)	Assumed 4,500 gpm, 4 hour duration [1]
Pipeline Design Parameters	
Minimum Pipe Size = 8" PVC	
Hazen - Williams Coefficient = 120 (6" to 12" pipes)	
Hazen - Williams Coefficient = 130 (12" and larger pipes)

SANTA PAULA WEST BUSINESS PARK SANITARY SEWER TECHNICAL REPORT

Introduction

The Santa Paula West project is a planned commercial and industrial development containing a mixture of industrial, research and development, retail, office and commercial uses. The Specific Plan project site is located just outside the limits, but within the sphere of influence, of the City of Santa Paula. The land use to the west and to the south is agriculture. Highway 126 runs along the south edge of the specific plan area, and to the east is existing industrial and commercial development. To the north is Telegraph Road and residential development. The Regional Location Map is shown below as Figure 1.

FIGURE 1 - REGIONAL LOCATION MAP

Access to the site is provided by Beckwith Road, Telegraph Road, and Faulkner Road. Figure 2 shows the project location.

FIGURE 2 – PROJECT LOCATION MAP

Existing Conditions

The Santa Paula West Business Park project lies within the City of Santa Paula for wastewater services. The existing land use is currently agricultural. The existing sewer system in the area does not allow the site to connect into the surrounding system because of elevation constraints. The new City of Santa Paula Water Recycling Facility (WRF) is only 0.34 miles (1,800 LF) south of the project.

The City of Santa Paula commissioned a sewer study for reviewing the City's entire sewer system. This study, "Wastewater System Master Plan" prepared by Jensen Design & Survey, Inc. in June 2012. The "Wastewater System Master Plan" identifies Santa Paula West as a future expansion area. Once annexed, Santa Paula West will be within the City's limits and this report will demonstrate anticipated flows from Santa Paula West as well as other notable projects in and around the Santa Paula West project.

The Santa Paula West Business Park project will be connecting to the existing 12" sewer in Faulkner Road, which connects to a 15" sewer that travels under Highway 126 towards Corporation Street. The existing 15" sewer connects to an existing 42" sewer that ultimately leads to the Santa Paula WRF. The proposed connection and existing sewer configuration are shown in Exhibit 9A and the existing and future sewer capacities for these lines are listed in Figure 9B.

Objectives

The objective of this study is to provide a blueprint for the design of the sanitary system within the Santa Paula West Business Park project as well as developing conceptual design parameters. The Santa Paula West project will be designed to meet or exceed the City of Santa Paula's sewer design criterion as established in the City's "Wastewater System Master Plan" and City Standard Plan.

Procedure

The Santa Paula West sewer system was developed utilizing the following 6 basic design steps:

1. Define Design Parameters

Design parameters for the sewer system were developed from the City's "Wastewater System Master Plan" as set forth in Chapter 6 – Sewer Flow Model. The criterion used in this analysis follows those set forth in Table 6-1. The design parameters used for this report can be seen in Figure 3.

2. Define Land Use Types and Locations

Land uses were defined utilizing the Specific Plan for Santa Paula West, specifically Chapter 2 – Land Use and Circulation. The land use types used in this report can be seen in Figure 5A and 5B. During the tentative map stage, a specific sewer system model will be developed and processed. The modeling included herein will provide for an upper boundary (most conservative) analysis should the ultimate development proceed.

3. Assign Sewer Generation Factors

Based on the aforementioned design parameters, specific sewer generation rates were applied. The sewer generation rate is considered 75% of the annual water demand based on Section 3 of the City's "Wastewater Master Plan". The sewer generation factors can be seen in Figure 4.

4. Model Sewer Flows / Link Flows

After gross acreage was calculated for each contributing area they received a sewer generation rate based on the factors in Figure 4. The resultant sewer flows were calculated using Flowmaster, preliminary design slopes and pipe sizes. The results of this model can be seen in Figures 6 and 7.

5. Prepare Summary Graphic

After flows were logically linked together in a model, a resultant sewer system graphic was prepared. The results of this model can be seen in Figure 8. A schematic detail of the connection to the existing sewer main in Faulkner Road leading to the City of Santa Paula WRF is shown in Figure 9A.

Proposed Sewer System

The Santa Paula West Business Park Specific Plan is located in an area with minimal sewer service. The project is proposing the best fit alignment connecting to the existing 12” sewer main in Faulkner Road, leading to the City of Santa Paula WRF given the site design constraints. Onsite sewer will drain through one new 12” main running east/west along the southerly property line in Faulkner Road. The gravity system continue east along Faulkner Road to a lift station located at the southeast corner of the site. The lift station will pump flows approximately 8’ vertically after the undercrossing of the existing 72” storm drain system located at the intersection of Todd Lane and Faulkner Road. The 12” sewer main will connect to the existing 12” sewer main in Faulkner Road. Refer to Figure 8 for the proposed onsite sewer layout. The proposed connection to the existing 12” sewer is shown in Exhibit 9A and the existing and proposed sewer capacities for the existing sewer lines at the connection point are listed in Exhibit 9B. As shown in Exhibit 9B, the proposed connection does not increase the depths in the existing sewer past the acceptable limits: 67% pipe diameter for pipes less than 12” and 75% pipe diameter for pipes 12” and greater.

The proposed project’s physical constraints and point of connection at the sewer main in Faulkner Road will not accommodate a gravity line using standard allowable design slopes and good design practices. Therefore, a lift station is proposed for the system at the southeast corner of the project site. The lift station will be designed to City of Santa Paula standards being automated with redundant pumps and adequate alarm systems. Complete design will be done during project improvement plan preparation.

Line A (reaches 1-7): Line A serves as the backbone for conveying the flows from the entire development to the connection to the existing sewer in Faulkner Road and ultimately to the water recycling facility. It runs from the existing manhole in Faulkner Road to the end future intersection of Beckwith Road and Faulkner Road.

Line B (reaches 7-22): Line B mainly serves the west side of the development. It connects into Line A at the future intersection of Beckwith Road and Faulkner Road.

Line C (reaches 23-30): Line C mainly serves the east side of the development. It connects into Line A at the future intersection of Beckwith Road and Faulkner Road.

Conclusions

Based on the modeling prepared by Jensen Design & Survey the Santa Paula West Business Park sewer system depicted in Figure 8 is in accordance with City of Santa Paula design guidelines. The Santa Paula West sewer system is in agreement with the design flows anticipated within the

City's Wastewater Master Plan for this development. Also, the main backbone, Line A, has additional capacity before reaching 50% pipe utilization of 465 gpm (1.04 cfs) for future connections.

EXECUTIVE SUMMARY

The purpose of this water supply assessment and verification (WSA/WSV) is to document the sufficiency of the local water supply to meet the demand of developed that could occur under the Santa Paula West Business Park Specific Plan (“Specific Plan” or “Project”). The Specific Plan area (“Project Site”) covers an area of approximately 53.81 acres of the West Area 2 Expansion Area of the City of Santa Paula’s General Plan. The Project includes the annexation of the Specific Plan area into the incorporated City limits. The Project includes a series of related actions, such as an amendment to the City’s General Plan Land Use Element and the zoning designations from the rezoning of the annexation area.

The Project land use designations, zoning, development standards, and other related land use specifications will govern future permitting of developments within the Specific Plan area. The Specific Plan designates the Project Site for light industrial and commercial uses, which is consistent with existing City rezoning and General Plan designations. These designations allow for the development of land uses consistent with offices, manufacturing, research and development, professional office, and limited commercial retail uses. Under the Specific Pan, these land use areas designated for development are integrated into one cohesive business park type of layout, complete with vehicular circulation, pedestrian walkways, and utility infrastructure.

The City’s General Plan requires the preparation and adoption of a Specific Plan for any identified expansion area prior to the City initiating annexation of the area to the City. Prior to considering the proposed Specific Plan for approval, the City is required to comply with the California Environmental Quality Act (CEQA). The City is currently preparing an Environmental Impact Report (EIR) to comply with CEQA.

The California Water Code (Sections 10910 through 10915) defines a “Project” as subject to the Code and thereby requiring a WSA. Section 10912 of the Water Code defines a “Project” under the law This includes any mixed-use project including more than 250,000 floor area of commercial space. by the public water system supplier that would provide water to a project. The goal of a WSA is to provide information on the availability of water supplies to be included in EIRs.

The City of Santa Paula Public Works Department, Water Division, provides water service in the City of Santa Paula and would provide water service to the proposed Project after annexation of the site to the City. Currently the Santa Paula Groundwater Basin (“Santa Paula Basin”) is the City’s sole source of water supply. Rights to withdraw groundwater from the Santa Paula Basin have been adjudicated, and the Santa Paula Basin is managed in accordance with this adjudication to ensure a safe groundwater yield. Recent

demand for water for the existing agricultural and associated uses on Santa Paula West Specific Plan site has averaged approximately 281.1 acre-feet per year (afy).

The eastern boundary of the Santa Paula Basin also demarcates the western boundary of the Fillmore Groundwater Basin (“Fillmore Basin”), which is generally located to the northeast of the Santa Paula Basin and upstream in relation to the Santa Clara River, which flows across both basins.

The City is required under California Water Code (Sections 10610 to 10656) to assess citywide water supply and demand over the next 20 years in 5-year increments in its Urban Water Management Plan (UWMP). The City completed its most recent update in 2010. The 2010 UWMP accomplishes water planning, including recycled water, over a 20-year period in 5-year increments; identifies and quantifies adequate water supplies for existing and future water demands in normal, dry, and multiple dry years; identifies actions to prepare for and implement during a catastrophic interruption of water supplies; and implements conservation and efficient use of urban water supplies. No decrease in availability of groundwater supplies is anticipated through the year 2035.

Conservative assumptions concerning future water demand are used in this WSA. The City’s 2010 UWMP provides per capita and specific use (commercial, industrial, and residential) demand rates for estimating future water demand. This WSA utilizes the commercial, industrial, and residential rates provided in the UWMP.

The City has constructed a new Water Recycling Facility (WRF). The City WRF will produce recycled water that meets California Title 22 regulations. The capacity of the City WRF is 4.2 million gallons per day (mgd), of which 1,622 afy is anticipated to produce recycled water. Recycled water is anticipated to be available for irrigation of landscape areas in 2015.

In order to estimate water demand for the type and amount of land uses that would be permitted by the proposed Project, the water demand factors contained in the City’s 2010 UWMP were used. Based on these factors, the annual average water demand for the proposed Project is approximately 39.8 afy (20.5 afy for Commercial/Light Industrial use, 1.5 afy for Light Industrial use, and 17.8 afy for landscape irrigation).

The allocated supply to West Area 2 per the 2010 UWMP Update is 88.8 afy.¹ The potable demand of 22.0 afy for the Commercial/Light Industrial and Light Industrial uses is 25 percent of the West Area 2 total

1 City of Santa Paula, Final 2010 UWMP Update (June 2011), Table 204, p. 16 (1,906,000 square feet of development at 2.03 afy).

supply allocation. The landscape areas will be irrigated using reclaimed water to be delivered from the City's wastewater treatment plant.

The Project will replace existing agricultural uses on the site. As such, water currently used for agricultural irrigation will be used instead for Project consumption. Currently, agricultural uses on the Project Site use approximately 281.1 afy (average over the past 5 years; see **Table 3**). As such, the proposed Project's consumption will be a net reduction in total water use of 241.3 afy.

It should be noted that the West Area 2 Planning Area has been allocated a supply of 88.8 afy based on future development. The proposed Project could utilize a portion of this allocation. However, with the removal of the agricultural uses currently on the Project Site, the Project can utilize a portion of the existing water currently used for irrigation. Existing wells will be utilized for construction water as the site is graded, in accordance with the Specific Plan, and then will be abandoned pursuant to state and local regulations.

The Project will use reclaimed water (17.8 afy) that will be available from the City's wastewater treatment facility for irrigation; this will further reduce the demand on potable water supplies. The City forecasts having between 400 afy (2015) and 1,622 afy (2035) of reclaimed water available for use (see **Table 13**). The Project will require only a portion (0.7 percent in 2017 and 2.6 percent in 2035).

The Santa Paula West Business Park recycled water system would operate via a proposed 12-inch distribution main called for by the City's Recycled Water Plan. This will allow the project to use recycled water when the City extends a recycled water line to the site and the plant is producing sufficient recycled water to supply the site.

In accordance with the City of Santa Paula Municipal Code, landowners or developers are required to either provide water rights sufficient to serve the property or pay an equivalent in-lieu fee as a condition of project approval or when the property is annexed. Upon annexation, the applicants will transfer a portion of these rights in sufficient quantity to meet all the anticipated water demands of the project.

In summary, this Water Supply Assessment for the proposed Project concludes that the City of Santa Paula's projected water supply for the 20-year period from 2017 to 2037 is adequate to meet the demand projected for the project, existing and planned future uses in the City in normal, single dry, and multiple dry years.

1.0 INTRODUCTION

The environmental review of the proposed Project is being prepared in compliance with the California Environmental Quality Act (CEQA) process. The City of Santa Paula (City), the Public Water System (PWS) for the proposed Project, has determined that a water supply assessment (WSA) is necessary to complete the proposed Project's CEQA process and that a written water supply verification (WSV) is needed prior to any necessary County of Ventura (County) and/or other City approvals for the proposed Project.

1.1 PURPOSE OF DOCUMENT

The purpose of this water assessment is to document the sufficiency of the local water supply to meet the demand associated with the proposed land uses of the Santa Paula West Business Park Specific Plan (proposed Project). It should be noted that this WSA/WSV addresses the overall water supply available to the City to meet the demands of existing customers and other future demands.

Adequacy of the delivery system is addressed in the City's 2010 Urban Water Management Plan Update (UWMP 2010 Update). The WSA/WSV reviews and makes a finding of reasonable sufficiency of water supplies that either are available or will be available to the City to meet future demands. The California Water Code requires a determination for a 20-year period (2017–2037) from the start of project development.

1.1.1 Water Supply Assessment

Requirements for the preparation of a WSA are set forth in Section 10910 of the California Water Code ("Water Code") in accordance with SB 610, which was enacted in 2001 and became effective January 1, 2002. The Water Code requires a WSA be prepared for any project, which would consist of one or more of the following:

- A proposed residential development of more than 500 dwelling units
- A proposed shopping center or business establishment employing more than 1,000 persons or having more than 500,000 square feet of floor space
- A proposed commercial office building employing more than 1,000 persons or having more than 250,000 square feet of floor space
- A hotel or motel with more than 500 rooms

- An industrial, manufacturing or processing plant, or industrial park planned to house more than 1,000 people, occupying more than 40 acres of land, or having more than 650,000 square feet of floor area
- A mixed-use project that includes one or more of the projects specified above
- A project that would demand an amount of water equivalent to, or greater than, the amount of water required by a 500-dwelling unit project
- For public water systems with fewer than 5,000 service connections, a project that meets the following criteria:
 - A proposed residential, business, commercial, hotel or motel, or industrial development that would account for an increase of 10 percent or more in the number of a public water system’s existing service connections
 - A mixed-use project that would demand an amount of water equivalent to, or greater than, the amount of water required by residential development that would represent an increase of 10 percent or more in the number of the public water system’s existing service connections

The proposed development is a “project,” as defined by Water Code Section 10912, and requires a WSA because it consists of an industrial park occupying more than 40 acres of land.

Section 10657 of the California Water Code requires cities and counties to request specific information on water supplies from the PWS that would serve any project that is subject to CEQA and is defined as a project in Water Code Section 10912. This information is to be incorporated into the environmental review document prepared pursuant to CEQA.

1.2 LOCATION

1.2.1 Regional Setting

The Santa Paula West Business Park Specific Plan area is directly adjacent to the western boundary of the City of Santa Paula, within the City Urban Restriction Boundary (CURB) of the City.

The City encompasses 4.5 square miles of incorporated area located approximately 17 miles inland from the Pacific Ocean in central Ventura County, as shown in **Figure 1, Regional Location Map**. The City lies within the Santa Clara River Valley, approximately 12 miles east of the City of San Buenaventura and approximately 9 miles west of the City of Fillmore.

SOURCE: Meridian Consultants – 2015

FIGURE 1

Regional Location Map

1.2.2 Community Setting

The Project Site is bound to the north by Telegraph Road, to the east by existing industrial and commercial development in the existing Santa Paula city limits, to the south by agriculture, and to the west by the Adams Barranca.

The Santa Paula West Business Park is located within the CURB of the City of Santa Paula, with frontage along State Route 126 and Telegraph Road, and is bisected by the railroad right-of-way as illustrated on **Figure 2, Project Location Map**. While it is just west of the Santa Paula City limits, it is within the City of Santa Paula Sphere of influence, and is outside of the Santa Paula-Ventura Greenbelt. Annexation of the Santa Paula West Business Park into the City of Santa Paula is planned to occur as part of the Specific Plan approval process.

1.3 PROJECT DESCRIPTION

1.3.1 Specific Plan Overview

The proposed Project consists of a specific plan for 53.81 acres of area located within the City's Sphere of Influence. The uses envisioned within the Santa Paula West Business Park will be a mix of low-intensity industrial (such as light manufacturing or research and development), professional office and supporting commercial businesses that are currently permitted in the Commercial/Light industrial and Light Industrial Zones of the City of Santa Paula.

The Santa Paula West Business Park Specific Plan would be adopted by the City, which would approve any request for annexation into the City. The Specific Plan would establish the necessary plans, development standards, regulations, infrastructure requirements, design guidelines, and implementation programs on which subsequent project-related development activities would be founded.

It is intended that local public works projects, design review plans, detailed site plans, grading and building permits, or any other action requiring ministerial or discretionary approval applicable to the Project Site would be consistent with the Specific Plan.

The 20-year scenario is used to illustrate total Project demand within the required 20-year WSA time frame (2017-2037) established by SB 610.

1.3.2 Land Use Plan

The proposed Project would be a mix of low-intensity industrial (such as light manufacturing or research and development), professional office, and supporting commercial businesses that are currently

permitted in the Commercial/Light industrial (C-LI) and Light Industrial Zones (LI) of the City of Santa Paula. These uses would cover approximately 41.96 acres, as shown in **Figure 3, Zoning Implementation Plan**. In addition, the Project would have approximately 4.9 acres of open space and approximately 6.95 acres of roadways that would not require any use of water. The Project Site would total approximately 53.81 acres, as shown in **Table 1, Land Use Summary**.

Table 1
Land Use Summary

Land Use Type	Acres	Percent of Site
Commercial/Light Industrial	41.96	78.0%
Roadways (Approximate)	6.95	12.9%
Open Space/Passive	4.90	9.1%
Gross Area of SP West BP	53.81	100.0%

The Santa Paula West Business Park Specific Plan includes lists of permitted uses, including those permitted without any conditions and those that require conditional use permits (CUPs) and public use permits. All development within the Santa Paula West Business Park will adhere to the standards of the Specific Plan.

1.3.3 Water and Wastewater

Public Water Supply

Surface water and groundwater resources within the City of Santa Paula are managed by the United Water Conservation District. However, the City is responsible for water supply and distribution within its 4.5-square-mile service area. The Project is located outside of the City's corporate boundary but within the West Area 2 identified in the General Plan for future expansion. A portion of the Project area is currently located in the City's water service area, and the entire site would be located within the City's service area after annexation of the site to the City.

The City currently has approximately 7,278 domestic water connections, and total 2010 water demand within the City was 4,416 acre-feet. The City does not generally provide wholesale water to any other agencies, nor purchase water from any wholesale agency. However, in 2010 the City provided 39 af to the Middleroad Mutual Water Company. The City does not use potable supplies for saline barriers, groundwater recharge, conjunctive use, raw water, or recycled water uses.²

Development in the City has been dependent on groundwater as a source of supply. However, the demand for groundwater is within the limits of natural recharge of the Santa Paula Basin.

Potable Water

The City of Santa Paula would provide water service for the Project Site. Existing wells will be utilized for construction water as the site is graded, in accordance with the Specific Plan, and then will be abandoned pursuant to state and local regulations.

As shown on **Figure 4, Conceptual Domestic and Recycled Water Plan**, the system for the Specific Plan domestic water system would operate entirely within the City's 200 Zone, and would receive water via proposed 12-inch distribution mains as called for in the City's Potable Water System Master Plan. The point of connection (POC) for the Project will be at Faulkner Road and Telegraph Road. The existing 8-inch ACP located in Beckwith Road will remain in place.

From the POC, a new 12-inch line will proceed north through the proposed Project. The proposed distribution system will be comprised of 8-inch through 12-inch mains. The water mains located in Beckwith Road, Road "A", and Faulkner Road will be publicly owned and maintained, while the remaining onsite domestic and fire will be master metered.

Irrigation and Fire Suppression System

A water system analysis would be prepared during the final construction documents to ensure that the required fire flow is provided at each fire hydrant and each fire sprinkler system. Every building would be required to provide an approved fire sprinkler system and all system designs would follow the guidelines identified in the CVWD Design Manual.

Wastewater

The City of Santa Paula would provide service for the Project Site. The City's wastewater system includes over 60 miles of sewer lines and the new City Water Recycling Facility (WRF). The estimated amount of City potable water that becomes wastewater is 47 percent based on 2010 City data.³ Estimated 2010 City wastewater generation rate is 58 gallons per capita per day (City). The WRF is reporting an average daily flow of 1.97 MGD for the year of 2011-2012.⁴

There is no existing sewer system in the Santa Paula West Business Park Specific Plan area. The City's *Wastewater System Management Plan* identifies a new off-site mainline that will need to be completed prior to implementation of the Specific Plan. These improvements would bring the POC for sewer service

3 City of Santa Paula, *Final UWMP Update* (June 2011), 45.

4 City of Santa Paula, *Wastewater System Master Plan* (June 2012).

of the Santa Paula West Business Park to the intersection of Beckwith Road and Faulkner Road at the southeast corner of the Santa Paula West Business Park area. **Figure 5, Conceptual Sewer Plan**, identifies the lines, directions, and points of connection.

1.4 PROJECT SPECIFIC WATER DEMAND

To estimate water demand for the type and amount of land uses that would be permitted by the proposed Specific Plan, the water demand factors contained in the City's 2010 UWMP Update were used.

The unit water usage for this WSA/WSV are based on indoor water use performance standard as provided in the California Water Code for residential water demand; the American Water Works Association Research Foundation for commercial water demands; and the City's Landscape Ordinance which meets the water conservation goals of the California Department of Water Resources (DWR) Model Water Efficient Landscape Ordinance (MWELO). The overall goal of the ordinance is to reduce landscape water use, reduce or eliminate runoff in streets, and limit turf.

The Project planning area includes a total of 53.81 acres within located with West Area 2 in the City's Planning Area. To provide a more accurate estimate of the proposed Project's water demand, a site-specific analysis was completed. Potable water demand was calculated for all uses based on Project-specific estimates.

The projected water demands are distinguished between indoor and outdoor usage. **Table 2, Estimated Project Water Demands**, summarizes the indoor water demands of the residential portion of the Project.

Table 2
Estimated Project Water Demands

Land Use	Sq. Ft./ Acreage	Demand Rate ^a	Annual Demand (afy)
Commercial/Light Industrial ^b	442,743.84	15.1 gal./sq. ft./yr.	20.5
Light Industrial ^b	196,978.3	2.49 gal./sq. ft./yr.	1.5
Landscaped areas ^c	8.07	2.2 AF/acre/yr.	<u>17.8</u>
Total Estimated Demand			39.8

Notes: afy = acre-feet per year; gal./sq. ft./yr. = gallons per square foot per year.

^aDemand Rates per City of Santa Paula, Final UWMP Update (June 2011).

^bBuilding square footage for C-LI and LI land uses found by multiplying total area square footage by 0.35 FAR per the October 2016 Specific Plan.

^cLandscaped areas assume 15% of total area or 8.07 acres per the October 2016 Specific Plan.

FIGURE 5

The allocated supply to West Area 2 per the 2010 UWMP Update is 88.8 acre-feet per year (afy).⁵ The estimated potable demand for the proposed Project is approximately 25 percent of the West Area 2 total supply. The landscaped areas will be irrigated using reclaimed water to be delivered from the City's wastewater treatment plant. Construction is expected to begin in 2017 and be completed by 2020.

The Project will replace existing agricultural uses on the site. As such, water currently used for agricultural irrigation will be used instead for Project consumption.

In addition to the previously described City-specific water conservation measures, Project developers shall be required to implement the following features to assure the most efficient use of water resources throughout the life of the Project:⁶

- Develop a budget for landscape irrigation use, pursuant to Section 5.304.1 of the City's Municipal Code.
- For new water service or for addition or alteration requiring upgraded water service for landscaped areas of at least 1,000 square feet but not more than 5,000 square feet (the level at which Water Code §535 applies), separate submeters or metering devices shall be installed for outdoor potable water use.
- Automatic irrigation system controllers (weather with rain sensors or soil moisture based) installed at the time of final inspection.
- All planted landscape areas within the Santa Paula West Business Park will have irrigation systems that are fully automatic and employ the latest "Low Volume" water conservation design criteria. No overspray of irrigation water onto walkways, common area hardscape areas, or any architectural walls will be allowed.
- Landscape plant and tree materials will be chosen for aesthetic quality and will consist of at least 75% low maintenance, California or drought tolerant, and ability to retain and treat storm water runoff.

1.5 REGULATORY SETTING

1.5.1 California Department of Water Resources

The DWR released its *State Water Project Final Delivery Capability Report* ("Report") in July 2015. The Report updates the estimated water delivery capacity of the SWP for current conditions and two decades

5 City of Santa Paula, *Final UWMP Update* (June 2011), Table 204, pg. 16 (1,906,000 square feet of development at 2.03 afy).

6 California Green Building Code (2013), tit. 24, pt. 11, Revision Record for the State of California (July 1, 2015).

from 2015.⁷ The estimates include the best-known future effects of climate change and the anticipated changes in Sacramento River basin land uses. The assessment of current and future SWP reliability allows DWR to plan for reliable future water supplies in California.

1.5.2 Comprehensive Water Legislation

In November 2009, four legislative bills (SBX7-1, SBX7-6, SBX7-7, and SBX7-8) and the supporting bond bill (SBX7-2), creating a comprehensive water package designed to meet California’s water challenges, were approved by Governor Schwarzenegger.⁸ The legislation establishes the governmental framework to achieve the co-equal goals of providing a more reliable water supply to California and restoring and enhancing the San Francisco Bay/Sacramento-San Joaquin Delta Estuary (“Bay-Delta”) ecosystem. The package includes requirements to improve the management of our water resources by monitoring groundwater basins, developing agricultural water management plans, reducing statewide per capita water consumption 20 percent by 2020, and reporting water diversions and uses in the Delta. It also appropriates \$250 million for grants and expenditures for projects to reduce dependence on the Delta if the bond issue is approved by the voters in the future.

The Safe, Clean, and Reliable Drinking Water Supply Act of 2010 (SBX7-2) was placed and passed on the November 2014 ballot as California Proposition 1, the Water Bond (Assembly Bill [AB] 1471). AB 1471 provides funding for California’s aging water infrastructure, as well as for projects and programs to improve the ecosystem and water supply reliability for California. The bond bill includes \$2.7 billion for actions improving Bay-Delta sustainability. These investments will help to reduce seismic risk to Bay-Delta water supplies, protect drinking water quality, and reduce conflict between water management and environmental protection.

Part of the comprehensive water package included SBX7-7 (Steinberg, Chapter 4, Statutes of 2009—Statewide Water Conservation). This bill creates a framework for future planning and actions by urban and agricultural water suppliers to reduce California’s water use. SBX7-7 requires the development of agricultural water management plans and requires urban water agencies to reduce statewide per capita water consumption 20 percent by 2020. CVWD has included the provisions of SBX7-7 in its 2010 UWMP and has reduced water demand by 20 percent since 2006.

7 Department of Water Resources (DWR), *The State Water Project Final Delivery Capability Report 2015*, July 1, 2015 <https://msb.water.ca.gov/documents/86800/144575dd-0be1-4d2d-aeff-8d7a2a7b21e4>.

8 (DWR, *California Water Plan Update 2009*, vol. 4 (December 2009). Reference Guide, Legislation, 2009 Comprehensive Water Package, Special Session Policy Bills and Bond Summary, (November 2009).

On January 17, 2014, California Governor Brown declared a drought state of emergency, and directed state officials to take all necessary actions to prepare for these drought conditions.⁹ State agencies, led by the Department of Water Resources, are in the process of executing a statewide water conservation campaign, calling on Californians to reduce their water usage by 20 percent.

1.5.3 Recent Regulations, Executive Orders and SWRCB Actions

Executive Orders

On January 17, 2014, Governor Edmund G. Brown Jr. declared a drought state of emergency.¹⁰ On April 25, 2014, the governor signed Executive Order B-26-14¹¹ (April 2014 Proclamation) stating, among other things, that

“severe drought conditions continue to present urgent challenges: water shortages in communities across the state, greatly increased wildfire activity, diminished water for agricultural production, degraded habitat for many fish and wildlife species, threat of saltwater contamination of large fresh water supplies conveyed through the Sacramento-San Joaquin Bay Delta, and additional water scarcity if drought conditions continue into 2015.”

On December 22, 2014, Governor Brown issued Executive Order B-28-14,¹² which extended the suspension of certain activities subject to CEQA contained in the January 2014 and April 2014 Proclamations, including the SWRCB adoption of emergency regulations pursuant to Water Code section 1058.5, through May 31, 2016. On March 17, 2015, the SWRCB adopted an expanded emergency conservation regulation prohibiting certain irrigation practices, restricting certain commercial activities, and ordering all urban water suppliers to implement mandatory restrictions on outdoor irrigation. The emergency regulation orders larger urban water suppliers—those providing water for municipal purposes to more than 3,000 customers or supplying more than 3,000 acre-feet of water annually, excluding wholesalers—to provide monthly data on water production, enforcement, and outdoor water conservation measures being implemented.

9 Office of the Governor, “Governor Brown Declares Drought State of Emergency” (January 17, 2014), <http://gov.ca.gov/news.php?id=18368>.

10 Office of the Governor, “Governor Brown Declares Drought State of Emergency” (January 17, 2014), <http://gov.ca.gov/news.php?id=18368>.

11 Office of the Governor, “Governor Brown Issues Executive Order to Redouble State Drought Actions” (April 25, 2014), <http://gov.ca.gov/news.php?id=18496>.

12 Office of the Governor, “Executive Order B-28-14” (December 22, 2014), <https://www.gov.ca.gov/news.php?id=18815>.

On April 1, 2015, Governor Brown signed Executive Order B-29-15,¹³ directing the SWRCB to impose restrictions to achieve a statewide 25 percent reduction in potable urban water usage, compared to the amount used in 2013, through February 2016. The governor instructed the SWRCB to consider the relative per capita water usage of each supplier's service area and to require those areas with high per capita use to achieve proportionally greater reductions than those with low use. The order mandates that the governor's January 17, 2014, Proclamation, April 25, 2014, Proclamation, Executive Order B-26-14, and Executive Order B-28-14 remain in full force and effect except as modified.

State Water Resources Control Board

In 2014, the State Water Resources Control Board (SWRCB) determined that an emergency existed due to severe drought conditions and that adoption of the proposed emergency regulation was necessary to address the emergency. California is currently in the fourth year of a significant drought resulting in severe impacts to California's water supplies and its ability to meet all the demands for water in the State.

On May 5, 2015, the SWRCB adopted an emergency conservation regulation in accordance with the governor's directive. The provisions of the emergency regulation went into effect on May 18, 2015.¹⁴ The emergency regulation identifies how much water communities must conserve based on their average residential water use, per person per day, last summer. Every person should be able keep indoor water use to no more than 55 gallons per day. For the most part, the amount of water that each person uses in excess of this amount is water that is applied to lawns and other ornamental landscapes.

To reduce water use by 25 percent statewide, a regulation adopted by the SWRCB places each urban water supplier into one of eight tiers, each of which is assigned a conservation standard, ranging between 4 and 36 percent.¹⁵

As of March 2016, the City of Santa Paula had a Conservation Standard of 26 percent as directed by the SWRCB; from March to June 2016, the City had achieved 24.2 percent water savings. The Governor issued

15 State of California, Office of Administrative Law, OAL File No. 2015-0506-02 EE, Notice of Approval of Emergency Regulatory Action, State Water Resources Control Board (May 18, 2015). http://www.waterboards.ca.gov/waterrights/water_issues/programs/drought/docs/emergency_regulations/oal_approve_d_regs2015.pdf.

new Executive Order, as of June 1, 2016, reducing the Conservation Standards as a result of improved conditions, and the City now has a zero percent conservation standard.¹⁶

Legislative Actions

Sustainable Groundwater Management Act

In September 2014, Governor Edmund G. Brown Jr. signed a three-bill package known as the Sustainable Groundwater Management Act (SGMA). The legislation allows local agencies to customize groundwater sustainability plans to their regional economic and environmental needs. SGMA creates a framework for sustainable, local groundwater management for the first time in California history. SGMA empowers local agencies to adopt groundwater management plans that are tailored to the resources and needs of their communities.

The three bills that make up SGMA are AB 1739 (Dickinson), SB 1168 (Pavley) and SB 1319 (Pavley).

AB 1739—Groundwater Management

AB 1739 (Dickinson) authorizes the DWR or a groundwater sustainability agency (GSA) to provide technical assistance to entities that extract or use groundwater to promote water conservation and protect groundwater resources. This bill requires the DWR, by January 1, 2017, to publish on its Internet website best management practices for the sustainable management of groundwater, and requires the DWR to prepare and release a report by December 31, 2016, on the agency's best estimate of water available for replenishment of groundwater in the state.

AB 1739 requires a GSA to submit a groundwater sustainability plan (GSP) to DWR for review upon adoption. The bill authorizes a local agency to submit to DWR for evaluation and assessment an alternative that the local agency believes satisfies the objectives of these provisions. AB 1739 also requires DWR to review any of the above-described submissions at least every 5 years after initial submission to DWR.

In addition, AB 1739 requires that prior to the adoption or any substantial amendment of a general plan, the planning agency review and consider a GSP; groundwater management plan; groundwater management court order, judgment, or decree; adjudication of water rights; or a certain order or interim plan by the SWRCB. AB 1739 requires the planning agency to refer a proposed action to adopt or

¹⁶ State Water Resources Control Board, Self-Certification Conservation Standards—"Stress-test" (by supplier), http://www.waterboards.ca.gov/water_issues/programs/conservation_portal/docs/emergency_reg/uw_self-cert_summary.pdf. Accessed October 18, 2016.

substantially amend a general plan to any GSA that has adopted a GSP or local agency that otherwise manages groundwater, and to the SWRCB if it has adopted an interim plan that includes territory within the planning area.

SB 1168—Groundwater Management

SB 1168 (Pavley) notes that the policy of the state is that groundwater resources be managed sustainably for long-term reliability and multiple economic, social, and environmental benefits for current and future beneficial uses. This bill states that sustainable groundwater management is best achieved locally through the development, implementation, and updating of plans and programs based on the best available science.

SB 1168 requires DWR to categorize each basin as high, medium, low, or very low priority. The initial priority for each basin was to be established no later than January 31, 2015. The bill authorizes a local agency to request that DWR revise the boundaries of a basin and required DWR to adopt by January 1, 2016, regulations on the methodology and criteria to be used to evaluate the proposed revision.

In addition, all groundwater basins designated as high- or medium-priority basins by the DWR that are designated as basins subject to critical conditions of overdraft are to be managed under a GSP or coordinated GSPs by January 31, 2020; all other groundwater basins designated as high- or medium-priority basins are to be managed under a GSP or coordinated GSPs by January 31, 2022.

This bill would authorize any local agency, as defined, or combination of local agencies to elect to be a GSA and would require, within 30 days of electing to be or forming a GSA, said agency to inform the DWR of its election or formation and its intent to undertake sustainable groundwater management.

SB 1319—Groundwater

SB 1319 (Pavley) prohibits the SWRCB from establishing an interim plan to remedy a condition where the groundwater extractions result in significant depletions of interconnected surface waters until January 1, 2025. This provision delays the similar provision in AB 1739 from 2022 to 2025. The bill further requires the SWRCB to exclude any portion of a basin in compliance with groundwater management requirements

from probationary status. This provision narrows the similar provision in AB 1739 to only apply to the portion of the basin that is out of compliance.

The bill requires the SWRCB to include any element of a GSP or the entire plan in its interim plan if SWRCB finds it would help meet the sustainability goal. This provision revises the similar provision in AB 1739 to allow for the inclusion of local plans when developing interim plans for basins with probationary status.

A GSP has not yet been adopted for the Santa Paula Basin pursuant to SGMA and is not required until 2022.

SB 1262 (Pavley)—Water Supply Planning

In September 2016, Governor Brown signed SB 1262 (Pavley), which states that if a water supply for a proposed project includes groundwater from a basin that is not adjudicated and is designated as medium or high priority, the following additional information must be included in the WSA: whether DWR has identified the basin as being subject to critical conditions of overdraft; and if a GSA has adopted a (GSP) or approved an alternative plan under the SGMA, a copy of the GSP, or an alternative plan. For a basin that is not adjudicated and is designated by DWR as low or very low priority, the WSA must include information as to whether DWR has identified the basin as being overdrafted or projected that the basin will become overdrafted if present management conditions continue.

SB 1262 is not effective until January 1, 2017. However, as noted earlier, pursuant to SB 1262 and the amended Water Code Section 10910, the Santa Paula Basin is an adjudicated Basin of which the DWR has not indicated is in overdraft.¹⁷

1.5.4 United Water Conservation District

The United Water Conservation District (UWCD or District) is a public agency that encompasses nearly 213,000 acres of central and southern Ventura County. The District covers the downstream (Ventura County) portion of the valley of the Santa Clara River, as well as the Oxnard Plain. The District serves as a steward for managing the surface water and groundwater resources for all or portions of eight interconnected groundwater sub-basins. The developed areas of the District are a mix of agriculture and urban areas, with prime agricultural land supporting high-dollar crops such as avocados, berries, row crops, tomatoes, lemons, oranges, flowers, ornamental nursery stock, and sod. Approximately 370,000 people live within the District boundaries, including those living in the cities of Oxnard, Port Hueneme, Santa Paula, Fillmore, and eastern Ventura.

17 California's Groundwater Bulletin 118, Santa Clara River Valley Basin Santa Paula Subbasin, http://www.water.ca.gov/pubs/groundwater/bulletin_118/basindescriptions/4-4.04.pdf.

The District is authorized under its principal act (California Water Code Section 74000 et. Seq.) to exercise multiple powers; including the authority to conduct water resource investigations, acquire water rights, build facilities to store and recharge water, construct wells and pipelines for water deliveries, commence actions involving water rights and water use, prevent interference with or diminution of stream/river flows and their associated natural subterranean supply of water, and to acquire and operate recreational facilities in connection with dams, reservoirs, or other District works.

1.5.4 City of Santa Paula

2010 Urban Water Management Plan Update

Section 10610 et seq. of the California Water Code, known as the Urban Water Management Planning Act, calls for creation and periodic update of UWMPs by all urban water suppliers and sets forth the requirements for such plans, including definition of relevant terms.

Under the definition given in Section 10617, an urban water supplier is an entity “providing water for municipal purposes either directly or indirectly to more than 3,000 customers or supplying more than 3,000 acre-feet of water annually.” Water for this development will be supplied from the City of Santa Paula’s existing water system which is supplied via groundwater wells throughout the City.

In 2011, the City of Santa Paula completed an UWMP update that included the portions of the East Area 2 Annexation Area located east of the City, south of the Ventura County Transportation Commission railroad, surrounds Hallock Drive area, but excluded the triangle area north of Hallock Drive.¹⁸ This UWMP did not discuss the specific development and activities contemplated by the Santa Paula West Business Park, although it did discuss, in general terms, the nature and extent of the long-term water supply for the City for the West Area 2 and included an estimated 1,906,000 square feet of commercial/industrial/institutional uses on approximately 125 acres. Much of this general discussion is cited and paraphrased in this WSA. The UWMP contains an analysis of the factors required by Government Code section 66437.7 (a)(2), and such factors apply to this WSA.

Accordingly, this WSA, in concert with the UWMP prepared by the City, includes all necessary data and analyses required by California Water Code section 10910 et seq. and by Government Code section 66437.7 et seq.

The 2010 UWMP is currently being updated to meet the DWR’s requirements for the 5-year update for 2015; a revised update is anticipated in early 2017.

18 City of Santa Paula, *General Plan*, “Land Use Element” (2013), LU-24.

2.0 WATER DEMANDS

2.1 HISTORICAL AND CURRENT CONDITIONS

2.1.1 Existing Land Use

The local economy is composed of agricultural, industrial, and commercial interests. Residential development is currently the single largest land use, encompassing over 37 percent of the land within the City. Santa Paula currently has a housing stock totaling approximately 8,500 units. Of these, 68 percent are single-family houses or condos, 22 percent are multifamily units, and 9 percent are mobile homes and trailers. Because a significant amount of its residential growth occurred prior to 1970, more than half of the housing stock in Santa Paula is over 30 years old. Commercial development comprises less than 5 percent of the City's area and industrial uses comprise approximately 6 percent.¹⁹ City water demands in 2005 were 5,046 acre-feet. Single-family residential accounts, the largest account class, represented 46 percent of water demands. Water demands were 4,416 acre-feet in 2010²⁰ and projected water demands in 2015 are 5,178 acre-feet.²¹

Future land uses are based on the City's General Plan. Within the City's existing limits and planning areas there is a potential for the following: 2,445 residential dwelling units (single- and multifamily); 131 acres of new commercial, industrial, and institutional development; and 411 acres of parks, recreation, golf courses, and open space.²²

The City's General Plan anticipates approval of an amendment of the City's 1978 Sphere of Influence to include six Expansion Areas, with a variety of land uses. Amending the Sphere of Influence boundary and annexing the Expansion Areas to the City requires the authorization of the Local Agency Formation Commission (LAFCO); previous LAFCO hearings approved Adams Canyon, Fagan Canyon, East Area 1, East Area 2, and West Area 2 for inclusion into the City's Sphere of Influence. Annexation of each Expansion Area will occur on a case-by-case basis after the completion of a Specific Plan and a market and fiscal evaluation; the City has recently completed annexation of two of these identified areas (East Area 1 [2010] and East Area 2 [2013]). In addition, each annexation area will require environmental review in accordance with CEQA. Ultimate build-out of residential units will be in accordance with the City's existing Growth Management Ordinance adopted in 1985. Type and amount of development that actually occurs will depend on many factors.

19 City of Santa Paula, *General Plan*, "Land Use Element" (rev. January 22, 2013), City Council Resolution No. 6821.

20 City of Santa Paula, *Final UWMP Update* (June 2011), 17.

21 *2010 Urban Water Management Plan Data—Tables*; DOST Table 11: Past, Current, and Projected Total Water Use, revised data as of October 22, 2014.

22 City of Santa Paula, *General Plan*, "Land Use Element." Rev 1/22/13, City Council Resolution No. 6821.

The proposed Project is located within the boundaries of the West Area 2 Expansion Area. The City's 2010 UWMP Update projects a water demand of 88.8 afy for West Area 2.²³ At approximately 53.81 acres, the Santa Paula West Business Park Specific Plan would take up approximately 43 percent of the 125-acre West Area 2 planned expansion as designed in the General Plan.²⁴ As such, based on a pro rata share of the proposed development contemplated in the General Plan for West Area 2 and the corresponding water demand estimated in the 2010 UWMP Update, the proposed Project has a projected demand of 39.4 afy.

The Santa Paula West Business Park Specific Plan site is currently in agricultural use.²⁵ Water is currently supplied by a single on-site water well, which supply water for both domestic and agricultural irrigation use.

2.1.2 Existing Water Supply and Demand

The existing land uses within the Specific Plan area includes approximately 54 acres of agricultural land, fallow agricultural land, and a small amount of industrial uses.

Water supply for irrigation on the Specific Plan area has been historically supplied from an on-site well that overlies the Santa Paula Basin. The existing well in the area (E11S) is owned and operated by McGaelic Group and Bender combined.

Approximately 49 acres of the Santa Paula West Specific Plan site is under cultivation for avocados, herbs, and a variety of row crops. Production records for the irrigation well for the period 2010 to 2014 are shown on **Table 3, Existing Well Pumping Records 2010 – 2014**. Water usage has been from one well but delivered to several parcels including McGaelic West (McGrath owners), Ilan Bender, and Jaime Santana; only the McGaelic West and Bender parcels are within the Project Site.²⁶ As shown on **Table 3**, over the last 5 years (2010 to 2014), the total water used on site has averaged 281.1 afy.

23 City of Santa Paula, *Final UWMP Update* (June 2011), Table 2-4, p. 16.

24 City of Santa Paula, *Santa Paula West Business Park Specific Plan* (amended October 2016).

2.2 WATER CONSERVATION MEASURES

2.2.1 State of California Measures

The State of California Assembly Bill (AB) 1881 was enacted in 2009 to help California move forward as a leader in sustainable landscaping and water efficiency and to address the danger of our drought situation. Many residential and commercial properties currently use outdated irrigation technology; AB 1881 is a forward-thinking standard that prevents excessive or wasteful irrigation techniques by emphasizing the use and application of modern irrigation technology.²⁷

With current drought conditions persisting, emergency regulation amendments are proposed.

Mandatory Prohibitions on Water Wasting

Water “waste” can be defined as any excessive, unnecessary or unwarranted use of water, including, but not limited to, any use that causes unnecessary runoff beyond the boundaries of any property as served by its meter and any failure to repair as soon as reasonably possible any leak or rupture in any water pipes, faucets, valves, plumbing fixtures, or other water service appliances.

California Code of Regulations: Model Water Efficient Landscape Ordinance

The Model Water Efficient Landscape Ordinance was adopted in January 1, 2010, to, but not limited, promote the conservation and efficient use of water and to prevent the waste of water; establish a

²⁷ Assembly Bill No. 1881, ch. 559 (January 23, 2006; approved, September 28, 2006; filed, September 28, 2006).

structure for planning, designing, installing, maintaining and managing water efficient landscapes in new construction and rehabilitated projects; establish provisions for water management practices and water waste prevention for existing landscapes; and to encourage local agencies and water purveyors to use economic incentives that promote the efficient use of water, such as implementing a tiered-rate structure.²⁸

California Green Building Standards Code (CALGreen)

The purpose of California Green Building Standards Code (“CALGreen”) is to improve public health, safety and general welfare by enhancing the design and construction of buildings through the use of building concepts having a reduced negative impact or positive environmental impact and encouraging sustainable construction practices in the following categories:

1. Planning and design
2. Energy efficiency
3. Water efficiency and conservation
4. Material conservation and resource efficiency
5. Environmental quality

The residential mandatory measures are provided in chapter 4 and the non-residential ones in chapter 5 of the CALGreen Code.

In response to State of Emergency proclamations issued by Governor Brown in January and April of 2014, and the Executive Order B-29-15 (issued April 1, 2015), California Department of Housing and Community Development (HCD) proposed emergency building standard regulations pertaining to the reduction of potable water use for exterior landscape irrigation for newly constructed residential buildings. HCD, in coordination with the California Building Standards Commission (CBSC),

Department of Water Resources (DWR), the Division of the State Architect, and other stakeholders developed emergency regulations that amend the 2016 CALGreen Code.²⁹

CALGreen provides mandatory residential measures, such as stormwater drainage and retention systems, which are thought to prevent flooding of adjacent properties and prevent pollution from stormwater

28 California Code of Regulations, tit. 23, Waters, div. 2, Department of Water Resources, ch. 2.7, Model Water Efficient Landscape Ordinance.

29 California Department of Housing and Community Development, Finding of Emergency Regarding the 2013 California Green Building Standards Code (CALGreen), California Code of Regulations, tit. 24, pt. 11.

runoff by retaining soil on site or by providing filtering to restrict sedimentation from reaching stormwater drainage systems and receiving streams or rivers. To comply, the retention basin must be sized and shown on the site plan, and water has to be filtered and routed to a public drainage system. The new residential structure also must comply with local stormwater ordinances. The drainage system must also be shown on the site plan (swales, drain piping, retention areas, and groundwater recharge).

The code also requires a 20 percent reduction of indoor water use, and it utilizes both a prescriptive and performance method. The prescriptive method provides some technical features that must be followed:

- Showerheads \leq 2.0 gallons per minute (gpm) at 80 pounds per square inch (psi)
- Lavatory faucets \leq 0.5 gpm at 60 psi
- Kitchen faucets \leq 1.8 gpm at 60 psi
- Urinals \leq 0.5 gal/flush
- Water closets \leq 1.28 gallon/flush

CALGreen also specifies acceptable performance standards for plumbing fixtures with reduced water usage. Fixtures can be installed if they meet standards listed in the code.

Outdoor water usage is also regulated. CALGreen requires irrigation controls to be weather or soil moisture based and to automatically adjust irrigation in response to changes in plants' needs as weather conditions change, or have rain sensors or communication systems that account for local rainfall.

2.2.2 City of Santa Paula

2010 Urban Water Management Plan (UWMP) Update

The City of Santa Paula has implemented water conservation measures to ensure that customers use water efficiently and that negligent use will have appropriate consequences. Water conservation policies are described in the 2010 Urban Water Management Plan Update.³⁰

Below is a partial list of current adopted water conservation policies:

- Water survey programs for single-family residential and multifamily residential customers
- Metering with commodity rates for all new connections
- Large landscape conservation programs and incentives
- Conservation programs for commercial, industrial, and institutional accounts
- Wholesale agency assistance programs
- Conservation pricing

³⁰ City of Santa Paula, *Final UWMP Update* (June 2011).

The combined effect of these policies places responsibility for water conservation on both the developer and the City.

The 2010 UWMP is currently being updated to meet the DWR's requirements for the 5-year update for 2015; a revised update is anticipated in early 2017.

City Municipal Code, Ordinance 993 Section 52.038—Water Waste

“No person shall [un]lawfully or neglectfully waste water in any manner whatsoever. Continued wasting of water after mailing of [City] notice by registered mail to the customer of record at the mailing address of record by the [City] Director may result in discontinued water service.”³¹ This Code is a beneficial tool to curb misuse and waste of potable water within the City. The provisions of the Code can be utilized during periods of normal water supply and supply deficiency. Violation of this Code is subject to City penalties.

City Municipal Code, Ordinance 1223, Chapter 59—Landscape Water Conservation Standards

In accordance with Government Code 65565(c) for the purpose of complying with California law and promoting water conservation the City maintains Ordinance 1223, Landscape Water Conservation Standards, to be utilized in conjunction with the City of Santa Paula Land Development Provisions for Landscaping and the Guidelines for Implementation of Water Efficient Landscape.³² Compliance with the guidelines and Landscape Water conservation Standards is mandatory for all new development projects that are subject to discretionary review by the City of Santa Paula.

Water Shortage Contingency Plan

The City's Water Shortage Contingency Plan was originally prepared to comply with AB 11x (1991). The bill required every urban water supplier to file a plan due to the worsening 1986-1992 drought.

The City has several options for meeting future water demands, including increased deliveries of local groundwater, increased deliveries of imported water, evaluating recycled water, and supporting water demand management programs. This has allowed the City, to date, to meet demands in spite of the prior drought conditions. Water shortages can be triggered by a hydrologic limitation in supply (i.e., a prolonged period of below-normal precipitation and runoff), limitations or failure of supply and treatment

31 City of Santa Paula, Santa Paula Municipal Code, Ordinance 993, sec. 52.038—Water Waste.

32 City of Santa Paula, Santa Paula Municipal Code, Ordinance 1223, ch. 59—Landscape Water Conservation Standards Ordinance (December 2009).

infrastructure, or both. Hydrologic or drought limitations tend to develop and abate more slowly, whereas infrastructure failure tends to happen quickly and relatively unpredictably.

Drought periods going back to 1929 have caused pumping levels to decrease, however there never has been a necessity to implement mandatory restrictions of water use. More efficient use of water was encouraged during the 1976 to 1977 period. An even greater awareness of water conservation occurred during the 1987 to 1992 drought. This increased awareness resulted in more efficient use of water.

Additional supply reductions could be caused by regional power outage, terrorist activity, earthquake, tsunami or other significant meteorological event. The City prepared an Emergency Response Plan (2004) which provides details of emergency responses for numerous significant events that may affect the City's water system.

Reductions in Santa Paula Basin Production Required by the Stipulated Judgment

According to the Judgment if it is found that the safe yield of the Santa Paula Basin is less than the total pumping allocations, then the pumping allocations shall be reduced. The Judgment specified that reductions in pumping will be required in the order of priority specified in **Table 4, Water Shortage Contingency—Rationing Stages to Address Water Supply Shortages**.

Table 4
Water Shortage Contingency—Rationing Stages to Address Water Supply Shortages

Stage	Water Supply Conditions
1	All uses in excess of the pumping allocations will be cut back to the approved allocations
2	Cumulative pumping allocation of the Santa Paula Basin Pumpers Association (SPBPA) will be reduced by 500 af annually. This reduction will reflect reasonable conservation that can be achieved. The SPBPA will determine how a reduction in its cumulative allocation will be implemented
3	Pumping allocation of the City of San Buenaventura shall be reduced to 1,141 af per year. This allocation reflects the City of San Buenaventura’s historical maximum annual production prior to the Judgment
4	The remaining pumping allocations of all parties to the Judgment will be further reduced simultaneously. The SPBPA will reduce their total annual allocations by 2,000 af. The City of San Buenaventura will reduce their total annual allocations by 500 AF
5	The City of San Buenaventura will cease pumping from the Santa Paula Basin
6	The remaining pumping allocations of the SPBPA will be reduced by the amount required to bring production into balance with the revised safe yield of the Santa Paula Basin

Source: City of Santa Paula, 2010 UWMP Update (June 2011), 57.

Proposed Water Demand Reduction Program

The City is establishing a water demand reduction program for worst-case planning purposes consisting of the implementation of a three-stage water demand reduction program. Stage 1 would impose a voluntary 15 percent water demand reduction goal, Stage 2 would impose an additional 15 percent mandatory reduction goal (total of 30 percent), and Stage 3 would impose an additional 20 percent mandatory reduction goal, for an overall reduction in water demand of 50 percent. Each stage would be implemented as needed based on actual or anticipated supply reductions. It would be the responsibility of the City’s Public Works Director to monitor water supplies and demands on a daily basis. This would allow the City to determine the effects of reductions on water production within the system. If evidence of a shortage exists, the Public Works Director would determine the extent of the severity and recommend the applicable stage. The Public Works Director would notify the City Council of the water supply situation, and the Council would be responsible for ratifying the proposed measures. The water shortage restriction program and water rationing rate structure would be adopted by the City Council as a new City ordinance.

Proposed specific water demand reduction measures and triggering mechanisms for each stage are listed in the 2010 UWMP Update and presented below.³³

³³ City of Santa Paula, *Final UWMP Update* (June 2011).

Stage 1: 15 Percent Reduction—Supply Watch

Stage 1 would be implemented when 5 to 15 percent reduction in water production capacity (or supplies) occurs or is anticipated. This reduction could be due to fire, earthquake, system failures, water quality contamination, or other event. All restrictions during Stage 1 are voluntary. The goal for Stage 1 is 15 percent reduction in water demand. Measures to be implemented during this stage include but are not limited to the following:

- City to communicate to the customers through press releases, brochures, mail-outs, and/or water bills the need to voluntarily conserve water and the many ways possible to conserve without affecting their overall lifestyles.
- Water customers requested to voluntarily limit the irrigation of landscaped areas.
- Water customers requested to voluntary limit non-essential water use. Non-essential water used defined as:
 - Use of water to wash any motor vehicle, motorbike, airplane, or other vehicle.
 - Use of water to wash down sidewalks, walkways, driveways, parking lots, tennis courts, or other hard-surfaced areas.
 - Use of water to wash down buildings or structures for purposes other than immediate fire protection.
 - Flushing gutters or permitting water to run or accumulate in any gutter or street.
 - Use of water to fill, refill, or add to any outdoor or indoor swimming pools, or Jacuzzi-type pools.
 - Use of water in a fountain or pond for aesthetic or scenic purposes except where necessary to support aquatic life.
 - Failure to repair a controllable leak within a reasonable period after having been given notice directing the repair of such leak.

Stage 2: 30 Percent Mandatory Reduction—Supply Warning

Stage 2 would be implemented when a 15 to 30 percent reduction in water production capacity occurs or is anticipated. This reduction could be due to fire, earthquake, system failures, water quality contamination, or other event. All restrictions in Stage 2 are mandatory. The goal for Stage 2 is 30 percent reduction in water demand. Measures to be implemented during this stage include but are not limited to the following:

- Continue to maintain Stage 1 measures; however, they become mandatory in Stage 2.
- City to mail information to water customers regarding the importance of significant water use reductions.

- Implement a 30 percent decrease in water allocation based on a yearly average for metered services. For those users who exceed their allocation, impose a 25 percent penalty for the excess volume. Charge an additional \$25 “excess user” fee and install a flow restrictor for repeat offenders of excessive use.
- Enforce the non-essential water use discussed in Stage 1 and assess a \$25 fee to offenders.
- Irrigation shall be by means of hand-held hoses, hand-held buckets, soaker hoses, or drip irrigation only. The use of hose-end sprinklers or permanently installed automatic sprinkler systems are prohibited at all times.
- Prohibit watering landscape between 10 AM to 4 PM.
- All restaurants are prohibited from serving water to patrons except upon request of the patron.
- Appoint a Water Conservation Coordinator. This can be an individual already working for the City with related duties.

Stage 3: 50 Percent Mandatory Reduction – Supply Emergency

Stage 3 would be implemented when a 30 to 50 percent reduction in water production capacity occurs or is anticipated. This reduction could be due to fire, earthquake, system failures, water quality contamination, or other event. The goal for this stage is 50 percent reduction in water demand. Measures to be implemented during this stage include but are not limited to the following:

- Perform an evaluation of Stage 2 water conservation measures and implement those not completed. Public Works Director to report to the City Council as appropriate.
- Implement a 50 percent decrease in water allocations for metered water services and charge a \$50 “excess user” fee for repeat offenders.
- Prohibit watering landscape between 8 AM to 6 PM.
- All water use not required for health and safety is prohibited.

3.0 WATER SUPPLY ASSESSMENT

A WSA is required to identify and describe the water supply sources of the PWS that will serve the project.

State Water Code Section 10910(d) requires a WSA to include identification of any existing SWP water, water rights, or water service contracts relevant to the identified water supply for the proposed Project. A complete discussion of SWP source and Table A allocations is provided, as well as a description of the quantities of water received in prior years by the PWS is also to be provided.³⁴

3.1 IDENTIFICATION OF WATER SOURCES

3.1.1 Primary Water Source

The City of Santa Paula will provide water service to the proposed Project.³⁵ The City currently has secured water rights from two sources: groundwater allocation from the Santa Paula Basin and a surface water wheeling agreement with the Canyon Irrigation Company. Surface water from Santa Paula Creek was a major source of potable water supply for the City's service area until wells were drilled into the Santa Paula Basin to augment the supply from Santa Paula Creek. Currently the Santa Paula Basin is the City's sole source of water supply.

3.1.2 Analysis of Water Supply

Groundwater

As previously stated, the City of Santa Paula has been dependent primarily on groundwater as a source of domestic water supply. Groundwater is also used to supply water for crop irrigation and commercial and industrial uses within the City.

Water Code Section 10910 (f) requires additional information when a groundwater basin is cited as the water supply source for a project including a description of the basin, the rights of the PWS to use the basin, the overdraft status of the basin, any past or planned overdraft mitigation efforts, historical use of the basin by the PWS, projected use of the basin by the project, and a sufficiency analysis of the basin.

Description of the Aquifer

The Santa Paula Basin is a subbasin of the larger Santa Clara River Valley Groundwater Basin. Other subbasins within the Santa Clara River Valley Groundwater Basin include the Fillmore, Piru, Mound, and Oxnard Subbasins. Each of the five subbasins is an alluvial basin recharged, in part, by the Santa Clara

³⁴ California Water Code, sec. 10910–10915, 10910(b).

³⁵ City of Santa Paula, *Santa Paula West Business Park Specific Plan* (amended October 2016).

River.³⁶ For the sake of simplicity, and because the subbasins are subject to varying forms of management, this WSA refers to the Santa Paula Basin as basin rather than subbasin.

The Santa Paula Basin underlies the City of Santa Paula and unincorporated areas to the southwest of the City within the Santa Clara River Valley. The basin is bounded by the impervious rocks of the Topatopa Mountains to the north, impervious rocks of Oak Ridge and South Mountain, the Oak Ridge fault, and Saticoy fault on the south.³⁷ The eastern edge of the basin is marked by a bedrock constriction, with the boundary placed at the position of maximum rising water. The western boundary separates the Santa Paula basin from the Mound and Oxnard subbasins, with the western boundary placed where there is a distinct change in the slope of the water table. Ground surface elevations range from 140 feet above sea level in the west to about 1,000 feet above sea level along the Santa Paula Creek drainage. The Santa Clara River and Santa Paula Creek drain the valley westward toward the Pacific Ocean. Average annual precipitation ranges from 14 to 18 inches.

The principal fresh water-bearing strata of the Santa Paula basin are the Pleistocene San Pedro Formation, Pleistocene river deposits of the ancient Santa Clara River, alluvial fan deposits shed from the uplifted mountain blocks, and recent river and stream sediments deposited locally along the Santa Clara River and its tributaries. These water-bearing sediments are underlain by relatively impermeable Pliocene and older units. The sediments of the basin have been warped into a syncline that is oriented in a northeast-southwest direction along the center of the basin. To the east, the Santa Paula basin is in hydraulic connection with the Fillmore basin, its' primary source of recharge. To the south, the Oak Ridge fault forms a partial barrier to groundwater movement. On the north, the portion of the aquifer represented by the San Pedro Formation is exposed in an outcrop along the Sulphur Mountain foothills.

The western boundary of the Santa Paula Basin is more complex, with local uplift, artesian conditions, and faults mapped by some investigators. Although there is general agreement that there is hydraulic connection between Santa Paula Basin, the Oxnard Forebay Basin, and the Mound Basin, the degree of connection is uncertain. The Santa Paula Basin has a storage capacity of approximately 754,000 acre-feet. The basin is estimated to be approximately 90 percent full, for about 675,000 acre-feet of groundwater in storage.³⁸

36 California Resources Agency, DWR, *California's Groundwater*, Bulletin 118 Update 2003 (October 2003).

37 California Resources Agency, DWR, *California's Groundwater*, Bulletin 118 Update 2003 (October 2003).

38 California Resources Agency, DWR, *California's Groundwater*, Bulletin 118, Santa Clara River Valley Basin: Santa Paula Subbasin (February 2004).

As reported by the Ventura County Watershed Protection District, the 2014 total precipitation was 6.13 inches. The accumulated total rainfall to date for 2015 is 8.36, approximately 47 percent of normal, (17.66 inches).³⁹

The Basin is recharged by percolation of surface flow from the Santa Clara River, Santa Paula Creek, and other minor tributary streams, as well as subsurface flow from the Fillmore Basin.⁴⁰ Some of the surface flow in the Santa Clara River originates as release from Lake Piru and contains natural runoff of precipitation and imported State Water Project water, it is important to note that there has not been a release from Lake Piru in the last year due to drought.⁴¹ Control of the quagga mussel is another limiting factor for water release.⁴² Percolation of precipitation and unused irrigation waters provide additional recharge. Groundwater in the Santa Paula Basin generally flows toward the southwest.⁴³

Groundwater Extraction

While there have been periodic declines in water levels within the Santa Paula Groundwater Basin, the Basin is not considered to be in a state of overdraft. The “assumed initial yield” of the basin is 33,500 afy. Under the terms of the Judgment, a 7-year study period (1996 to 2003) formed the basis for determining actual safe yield. After 7 years, water use data was analyzed to refine the assumed initial yield of 33,500 afy. United Water Conservation District prepared a report (UWCD, 2003) on the status of the Santa Paula Basin. The UWCD Report concluded that the average groundwater production over the period 1983 to 1995 was 26,000 af. According to the Report, no overdraft was observed at the documented production rates over the period 1983 to 1995. The Report also identified that over the period 1997 to 2003 parties to the Judgment had cumulatively produced 42,111 af less than their combined total allocation for this period. Yield of the Santa Paula Groundwater Basin appeared to be no less than 26,000 afy (UWCD, 2003). Approximately 12,000 acres of agricultural land is irrigated by groundwater in the Santa Paula Basin. Groundwater extractions are reported on the semi-annual groundwater production statements filed with UWCD’s Finance Department by individual pumpers. These production statements constitute all known pumping from the Santa Paula basin. In calendar year 2011, 24,202 acre-feet of groundwater was extracted from the Santa Paula basin. A summary of the 2011 extractions is shown in **Table 5, Summary of Recent Groundwater Extractions**. The 2014 reported

43 State of California, Resources Agency, Department of Water Resources, *California Groundwater*, Bulletin 118 Update 2003, October 2003.

groundwater extractions of 27,437 acre-feet were greater than the average for the period of record (1980 to 2014) average of 25,771.⁴⁴ In addition to this information, the Urban Water Management Plan provides supplemental Groundwater pumping data for the City of Santa Paula as a whole, including projected pumping figures ongoing until 2035.

Summary of Recent Groundwater Extractions

Pumper	2013 Extractions (AF)	2014 Extractions (AF)
City of San Buenaventura	901	791
Santa Paula Basin Pumpers Association (SPBPA) Pumpers with Individual Party Allocations (adjusted extractions)	25,530	26,610
SPBPA Pumpers with Individual Party Allocations (reported extractions)	25,554	26,613
Non-stipulated Parties	14	17
De Minimis Pumpers	16	16
Total Production		
Adjusted by SPBPA	26,461	27,434
Reported to UWCD)	26,485	27,437

Source: Combined 2013 and 2014 Santa Paula Basin Annual Report (January 2016)

Long-term, gradual declines in water levels have been observed in many parts of the basin. These declines have not been rapid, and are relatively small, however, they are indicative of changing hydrologic conditions in the basin that warrant further monitoring, and if the trend persists, the development of alternative basin management strategies.

Water production for the period 2000 to 2010 is presented in **Table 6, City of Santa Paula Water Production**. According to City Water Division staff, total water produced in 2010 was 4,455 acre-feet (af). City water production in 2005 was 5,047 af (more than 591 compared to 2010). The highest annual water demand for the period 2000 to 2010 was recorded in 2002 with 5,359 af produced. Groundwater production during 2011 was less than the average in recent years, and precipitation was above average. This resulted in water level rises or stable water levels from 2010 to 2011.

⁴⁴ Combined 2013 and 2014 Santa Paula Basin Annual Report (January 2016)

Table 6
City of Santa Paula Water Production

Year	Groundwater Production from City Wells (acre-feet)
2000	5,254
2001	4,952
2002	5,359
2003	5,096
2004	5,208
2005	5,047
2006	5,143
2007	5,347
2008	5,290
2009	4,902
2010	4,455

Source: City of Santa Paula, Final 2010 UWMP Update (June 2011), Table 4-2.

The City's current groundwater supply includes production from five active wells. Domestic water is pumped from Well Nos. 1-B, 11, 12, 13, and 14. **Table 7, City of Santa Paula Groundwater Resources**, summarizes the City's groundwater resources by well including current status, well capacity, and 2010 production. The City no longer operates Wells Nos. 2, 8, and 9 due to a history of elevated nitrate levels in water extracted from these sources. These wells were sold to an agricultural enterprise.⁴⁵

Table 7
City of Santa Paula Groundwater Resources

Well No.	Status	Capacity (gpm)	2010 Production (acre-feet)
1-B	Active	1,288	114.9
11	Active	1,232	393.2
12	Active	1,448	1,768.8
13	Active	1,932	353.3
14	Active	3,219	1,825.5
Total		9,119	4,455.5

⁴⁵ City of Santa Paula, Final UWMP Update (June 2011).

Pumping Allocations

The Judgment governs groundwater production on a seven-year rolling average, which allows parties to produce more or less allocation in any particular year so long as their rolling seven-year average does not exceed their allocation. The average is a rolling average, in 2014 the average extraction amount will be based on the period from 2008 to 2014.

The total combined pumping allocations of the SPBPA (party and non-party) and the City of San Buenaventura (Ventura) are now at 30,771.6 acre-feet/year. Amendments to the Judgment in 2010 provided the Santa Paula Basin Pumpers Association with an additional 280.2 acre-feet of allocation, which was granted to pumpers that were not previously parties to or identified within the Judgment. The current allocations were calculated and granted using the lesser of the following two options: 1) the average production reported to UWCD from calendar years 2002 through 2008; or 2) the average production reported to UWCD prior to the Judgment (1989 to 1995). Additionally, a total of 40.7 acre-feet of SPBPA's allocation is held in "reserve" by the SPBPA for nonparty pumpers have declined to stipulate and become parties to the Judgment. In addition, the City of Ventura has acquired 225.8 acre-feet of prior SPBPA allocation through water allocation transfers to the City.⁴⁶

The SPBPA's calendar year 2013 and 2014 allocations were 27,545.8 acre-feet/year (excluding non-parties) distributed among its members with a seven-year average surplus of 2,123.8 acre-feet from pumping below the allocation. The City of San Ventura's 2013 and 2014 allocations were 3,000 acre-feet plus 225.8 acre-feet of prior Santa Paula Basin Pumpers Association allocation with a seven-year average surplus of 2,293.6 acre-feet from pumping below its allocation.⁴⁷

The Judgment also allows for de minimis production by landowners that are not allocated an Individual Party Allocation, which allows these landowners to produce groundwater for uses on their overlying property so long as such use does not exceed 5 acre-feet in any particular year. In calendar years 2013 and 2014, there were five de minimis producers.⁴⁸

Historical Groundwater Levels

Historically, water level trends in the Santa Paula basin were summarized through the use of a Groundwater Level Index. The index includes nine key wells in the basin that were selected for their relatively long record and geographic distribution across the basin. The following observations were made of the Groundwater Level Index graph:

46 Combined 2013 and 2014 Santa Paula Basin Annual Report (January 2016)

47 Combined 2013 and 2014 Santa Paula Basin Annual Report (January 2016)

48 Combined 2013 and 2014 Santa Paula Basin Annual Report (January 2016)

- 1983 to drought period of 1990 and 1991 - declining index that directly mimics the declining cumulative departure from average precipitation trend;
- 1991 to 1998 – characterized as a wetter period than previous with an increasing index and cumulative departure from average precipitation;
- 1998 to 2011 – a net positive cumulative departure from average precipitation during this period with partial rebounds in in the groundwater level index during particularly wet water years 2005 and 2011;
- 2011 to 2014 – a steep decline in groundwater level index, corresponding to below-average precipitation since water year 2012, including the driest back-to-back water years 2013 and 2014 recorded since 1898 and 1899.

Since 2005 there have been three above average precipitation years, including 2011, and five below average precipitation years. In general, the trend in the Groundwater Level Index tends to follow the trend in the cumulative departure from average precipitation curve, i.e., trending down during drier-than-average periods and trending up during wetter-than-average periods.⁴⁹ As an update, since the year 2012, rainfall has declined to drought conditions. Total annual precipitation data for the Santa Paula area from 2010-2015 is presented in **Table 8, Annual Precipitation Totals: 2010–2015**.

Table 8
Annual Precipitation Totals: 2010–2015

Calendar Year	Total Annual Precip. Station 173A (in.)	Total Annual Precip. Station 245B (in.)	Total Annual Precip. Station 018B (in.)
2010	27.09	(18.48*)	—
2011	31.76	25.76	27.35
2012	12.55	9.85	6.52

Historical Groundwater Extraction

49 Combined 2013 and 2014 Santa Paula Basin Annual Report (January 2016)

The historical groundwater extractions for the Santa Paula basin are shown in **Table 9, Historical Santa Paula Basin Groundwater Extractions**. The extractions vary from a high of 33,453 acre-feet in 1990 during the peak of the last drought to a low of 16,710 acre-feet during the very wet year of 1983. The extractions during 2010 (a wet year) were reportedly 4,322 acre-feet below what was extracted in 2014 which received about one-third less water during the rainfall year.

Table 9
Historical Santa Paula Basin Groundwater Extractions

Calendar Year	Groundwater Extractions (acre-feet)	Calendar Year	Groundwater Extractions (acre-feet)	Calendar Year	Groundwater Extractions (acre-feet)
1980	26,820	1992	24,355	2004	27,306
1981	27,545	1993	26,998	2005	24,700
1982	22,925	1994	26,244	2006	24,830
1983	16,710	1995	25,042	2007	28,077
1984	29,455	1996	26,008	2008	26,686
1985	26,533	1997	28,961	2009	25,820
1986	21,617	1998	21,622	2010	23,115

1990	33,453	2002	27,259	2014	27,437
1991	27,056	2003	22,280	Average	25,695

Source: Combined 2013 and 2014 Santa Paula Basin Annual Report (January 2016))

While there have been periodic declines in water levels within the Santa Paula Basin, members of the SPBPA agree that the Santa Paula Basin is not in a state of overdraft. The parties agreed that the “assumed initial yield” of the basin is 33,500 acre-feet per year (afy). Under the terms of the Judgment, a 7-year study period (1996 to 2003) formed the basis for determining actual safe yield. After 7 years, water use data was analyzed to refine the assumed initial yield of 33,500 afy. United Water Conservation District prepared a report (UWCD, 2003) on the status of the Santa Paula Basin. The UWCD Report concluded that the average groundwater production over the period 1983 to 1995 was 26,000 af. According to the Report, no overdraft was observed at the documented production rates over the period 1983 to 1995. The Report also identified that over the period 1997 to 2003 parties to the Judgment had cumulatively produced

42,111 af less than their combined total allocation for this period. Yield of the Santa Paula Groundwater Basin appeared to be no less than 26,000 afy (UWCD, 2003).⁵⁰

Aquifer Adjudication

Disagreement over the issue of safe yield of groundwater between the UWCD and other parties using water from the Santa Paula Basin, including the City of Santa Paula and the City of San Buenaventura (Ventura), led to the adjudication of groundwater rights within the Santa Paula Basin in 1996. A stipulated judgment was agreed to by the parties, and after review and approval by the Ventura County Superior Court, was entered as a final judgment (Judgment) to adjudicate groundwater rights within the basin. In summary, the Judgment adjudicates groundwater rights, regulates individual and collective pumping, provides for basin management through a Technical Advisory Committee (TAC), and reserves jurisdiction in the Superior Court to resolve future disputes and provide for supplementary orders as necessary.⁵¹

The Judgment allocates the use of groundwater in the Santa Paula Basin between the City of Ventura and the SPBPA, which is a consortium of water users in the Santa Paula area, including the City and farming interests. UWCD is also a party to the Judgment. Although UWCD does not produce water from the Santa Paula Basin, the Basin is located within its boundaries and UWCD is authorized to engage in groundwater management and replenishment activities and to act to protect water supplies that are of common benefit to the lands and residents within UWCD.⁵²

Currently, the SPBPA possesses a collective groundwater right allocation of 27,515 afy that it holds in trust for its membership. The Judgment further subdivides the collective 27,515 afy allocation as sub-allocations to each of the SPBPA members and a few non-parties.⁵³ The allocations and sub-allocations are summarized in **Table 10, Santa Paula Basin Water Allocations (2010)**.

Pursuant to the terms of the Judgment, the City of Santa Paula has a sub-allocation of 5,483.3 afy available for urban uses. However, the City transferred 673 afy to Canyon Irrigation Company in January 1998. This amount could be adjusted if the terms of the Judgment are modified, or if the City acquires additional water rights from areas subject to development or from other users within the SPBPA.⁵⁴

City of San Buenaventura	3,000
Unallocated Reserve	2,985
Total	33,500

Source: City of Santa Paula, Final 2010UWMP Update (June 2011).

^a The City's current allocation is 5,483. State of California, Superior Court (2010). Amended and Restated Judgment, United Water Conservation District vs. City of San Buenaventura.

^b Includes Bender and McGaelic Farms.

The City of Ventura has an allocation to pump on average 3,000 afy under a Class II Emergency. A long-term drought situation affecting surface water supplies would be considered a Class II Emergency. In addition, the Judgment also provides for an unallocated reserve of 3,000 afy.⁵⁵

Water on the Project Site used for irrigation has been historically supplied from on-site wells. All wells are listed in the Judgment as being within the Santa Paula Basin. Withdrawals from all of the wells have been accounted for under the Santa Paula Basin Judgment. Currently, the members of the SPBPA have a cumulative allocation to pump on average 27,515 afy.⁵⁶ The Judgment sets forth an "assumed initial yield" of the basin at 33,500 afy, subject to modification if credible technical information demonstrates a need for a change. The Judgment also set forth a seven-year study period to evaluate the appropriateness of the assumed initial basin yield of 33,500 afy, which began on January 1, 1996. The average is a rolling average so in 2011 the average extraction amount will be based on the period from 2005 to 2011. After

55 City of Santa Paula, Final UWMP Update (June 2011).

56 City of Santa Paula, Final UWMP Update (June 2011), Appendix D, Exhibit C-1-b (July 2, 2010).

the 7-year study period, UWCD and the other member of the TAC collaborated to produce a study of the basin's groundwater conditions and the implications for the initial 33,500 afy yield allocation.⁵⁷

Groundwater production during 2014 was greater than the average in recent years, and precipitation was less than average. Production has remained less than the pumping allocations.⁵⁸ The observed decline in groundwater levels is a matter of some concern, but the decline has not been abrupt and further monitoring and research is in process to determine the cause of the decline and the most appropriate and cost-effective remedial action should this trend continue without stabilizing. More in-depth monitoring and research is underway to correlate annual basin recharge, discharge, and water level changes used to understand and determine the basin status.

UWCD has historical groundwater elevation data for 150 wells, 90 of which extensive records exist.⁵⁹ The other wells either have been destroyed or are no longer being monitored. Recorded groundwater level highs in 2009 and 2010 are below the recorded groundwater level highs seen in 1998. From 1998 to 2009, 47 wells show groundwater level declines, one well shows a groundwater level rise, one well shows no change in groundwater level and 26 wells have no groundwater level measurements in 1998 or 2009. From 1998 to 2010, 49 wells show groundwater level declines, one well shows a groundwater level rise, two wells show no change in groundwater levels and 23 wells have no groundwater level measurements in 1998 or 2010.

Since 1998, the basin has experienced only two significant wet years: 2001 at 26.54 inches of precipitation, and 2005 at 40.54 inches of precipitation.⁶⁰ The next highest precipitation years were in 2011 at 23.80, 2003 at 19.94 inches, and at 2010 at 19.33 inches. The groundwater level declines in the basin since 1998 are in response to this relatively dry period. If the basin is operating within a yield, groundwater levels should recover to 1998 levels or at least to 2005 levels with the onset of a wet period.⁶¹

The estimated subsurface outflow was reported by DWR in Bulletin 118 to be 7,200 afy. Average annual extraction was estimated to be 21,612 afy in Bulletin 118.⁶² Based on the most recent data from 2003, the average annual pumping rate of approximately 26,000 afy for the period from 1983 through 1995 is considered sustainable.⁶³ Furthermore, it is the opinion of the Santa Paula Technical Advisory Committee

57 Santa Paula Basins Expert Group, *Investigation of Santa Paula Basin Yield*, prepared for Santa Paula Basin Technical Advisory Committee, July 2003.

60 UWCD, *2011 Santa Paula Basin Annual Report*, Professional Paper 2011-001 (September 2013).

61 Combined 2013 and 2014 Santa Paula Basin Annual Report (January 2016)

62 California Department of Water Resources, *California's Groundwater Bulletin 118* (February 2004).

63 Santa Paula Basins Expert Group, *Investigation of Santa Paula Basin Yield*, prepared for Santa Paula Basin Technical Advisory Committee (July 2003).

that the yield of the basin is greater than the average annual production of 26,000 acre-feet. Fluctuations in groundwater levels correlate with precipitation trends, and long-term observations suggest that the Basin was not in a state of overdraft.⁶⁴ However, the TAC recommended that the yield remain at 33,500 afy.⁶⁵

Water Code section 10631 requires that this WSA (a) identify whether the DWR has determined, in the most recent official department bulletin, whether the Santa Paula Basin is presently in a state of overdraft or at risk of becoming overdrafted under current conditions; and (b) provide an analysis of the sufficiency of the Basin's groundwater supply to meet the projected water demands of the of the proposed Project. DWR's most recent assessment of conditions in the Santa Paula Basin was issued as part of DWR's Bulletin 118, Update 2003, which does not state that any portion of the Santa Paula Basin is presently, or was previously, in a state of overdraft.⁶⁶ Bulletin 118 does, however, report as follows:

Hydrographs from the Santa Paula Subbasin show a range of up to 55 feet in water level elevation since 1975. The hydrographs show an annual cyclic rise and fall of water level of about 20 feet with longer-term variations apparently following precipitation cycles. The subbasin was at a low level in 1991 and 1992, then recovered by 1994 and has remained stable since then.

A basin yield study by experts for the City of Ventura, SPBPA, and UWCD suggests that the safe yield of the basin is probably near the historic pumping amount.⁶⁷

The 2013 and 2014 Combined Annual Report for the Santa Paula Basin concluded that the majority of the wells monitored in the Santa Paula basin have experienced a gradual groundwater level decline; however, the changes vary from well to well and period to period with some wells showing a slight increase in groundwater levels, but the majority of wells showing a modest decline in water levels."⁶⁸

As the forgoing discussion illustrates the Santa Paula Basin is comprehensively managed by the TAC, UWCD, and the reserved jurisdiction of the Court, as provided in the Judgment. The basin's water tables have stabilized and appear to be sufficient to support the allocation of groundwater rights set forth within the Judgment. Moreover, groundwater production rights are defined and limited as a collective whole and in relation to each of SPBPA's individual members. This confinement and definition of the

68 Combined 2013 and 2014 Santa Paula Basin Annual Report (January 2016)

groundwater rights existing within the Basin provides additional certainty for the long-term reliability of the groundwater supply from the Basin.

Groundwater Allocation Transfers from Developed Properties

In accordance with City Municipal Code section 52.021 (Water Resource In-Lieu Fee Ordinance No. 1058), landowners or developers are required to transfer their groundwater rights to the City as a condition of project approval. The intent of the Ordinance is to ensure that new urban land users provide sufficient water resources for their needs without taxing existing users. If the associated water rights are not sufficient to serve the proposed development's anticipated water use (as determined by the City), or if the water rights are held by another entity who cannot or will not dedicate those rights to the City, the developer must purchase additional water rights and dedicate them to the City or pay a water resource in-lieu fee to the City. This ordinance applies to water rights within City limits as well as parcels outside City limits who must receive service from the City Water Enterprise.

The City identified 1,925 afy of potential groundwater allocations that could be transferred to the City from overlying landowners within the City General Plan boundary. One property includes a reserve of 110 afy for agricultural uses. Thus, the maximum potential net groundwater transfer is 1,815 afy. **Table 11, Existing and Potential City Water Resources and Demand**, contains a summary of existing and potential water resources. These transfers will occur in phases during the next 20 years as development occurs within the City. Transfers of allocations will need to be reported to the Technical Advisory Committee in accordance with the Judgment. The SPBPA will then transfer the applicable number of memberships (allocations) when transfers are between association members; a membership is equal to 1 afy of groundwater allocation.⁶⁹

*Projected data

Notes:

All values rounded to the nearest 1 af.

Santa Paula West Area Business Park Specific Plan would start construction in 2017 and be completed by 2027. Conservatively assumed full build-out Project Demand numbers in 2017.

The City's current (2011) allocation is 5,483 afy.

The City currently wheels the 500 afy of surface water from Santa Paula Creek to farmers Irrigation Company, which uses the surface water in lieu of pumped groundwater, and the City gains 500 afy groundwater pumping credits in the Santa Paula Basin.

Total of 1,815 afy allocation transfers achieved over four equal 5-year periods (approximately 454 afy per 5-year period).

The City anticipates purchasing groundwater allocations. It is anticipated that approximately 200 afy could be developed by 2015, 300 afy by 2020, 400 afy by 2025, and 497 afy by 2030.

The City has rights to 2,198 afy. However, actual delivery may be only 60 percent of water rights (DWR, 2010) in an average year, 7 percent in a single dry year, and 34 percent in multiple dry years. For the purposes of this UWMP, the City does not anticipate receiving SWP water in the near future.

The City purchased the WRF in 2015, however, currently there is no infrastructure to supply recycled water to the City. The 2010 UWMP anticipated that approximately 400 afy could be developed by 2015, 800 afy by 2020, 1,200 afy by 2025, and 1,622 afy by 2030.

The 2010 UWMP Update anticipates that the City will acquire through allocation transfers 454 afy by 2015, 908 afy by 2020, 1,362 afy by 2025, and 1,815 afy by 2030 and 2035 through allocation transfers within the Santa Paula Basin as provided for in the Judgment.⁷⁰

Implementation of these water supply programs is anticipated to provide the City with sufficient water supplies to meet future water demand. As shown in **Table 11**, the potential water supplies available to the City exceed the estimated water demand at City build-out conditions.

Purchased Groundwater Allocations

In 2005, it was determined that there were 497 afy of potentially available groundwater allocations held by others within the Santa Paula Groundwater Basin boundary that were not being utilized). The City has the option to independently pursue the acquisition of groundwater allocations at any time in the future. It is anticipated that the City will purchase 200 afy by 2015, 300 afy by 2020, 400 afy by 2025, and 497 afy by 2030.

State Water Project Water

The SWP's California Aqueduct is owned and operated by DWR. Ventura County contracted for 20,000 afy of SWP water with 5,000 afy of that amount subcontracted to the UWCD. The UWCD has designated 2,198 afy of SWP water for use by the City.⁷¹

DWR estimates it will be able to deliver 60 percent, or 2,527,629 acre-feet, of requested SWP water in 2016.⁷² The estimated demands by SWP contractors for deliveries of Table A water, 4,172 thousand acre-feet per year, is assumed to be the maximum delivery SWP delivery amount for the 2016 Delivery Capability Report. DWR considered several factors, including existing conditions, SWP operational constraints such as the conditions of the recent Biological Opinions for Delta Smelt, Salmonids and Longfin Smelt incidental take permit, and 2016 contractor demands. DWR may revise allocations if warranted by the year's developing hydrologic and water supply conditions.

Historical allocation made by the SWP for the State as a whole and for the Ventura County WD are represented in the **Table 12, SWP Historical Deliveries: 2010–2016**.

⁷⁰ City of Santa Paula, Final 2010 UWMP Update (June 2011).

⁷¹ City of Santa Paula, 2010 UWMP Update (June 2011), 42.

⁷² Department of Water Resources, California State Water Project, "Notice to State Water Project Contractors No. 16-06: 2016 State Water Project Allocation Increase—60 Percent (April 21, 2016).

For planning purposes, the City does not anticipate directly receiving SWP water in the near future. However, the City may trade, transfer, and/or sell a portion of the SWP water rights to augment existing supplies.

Table 12
SWP Historical Deliveries: 2010–2016
(acre-feet)

<http://www.water.ca.gov/swpao/deliveries.cfm>

Surface Water

The Santa Paula Creek has been and remains a valuable source of water for the City. The Creek has a drainage area of approximately 40 square miles (SPWW, 1995). The City owned the rights to the first 12 cubic feet per second (5,386 gallons per minute) of flow within the Santa Paula Creek (SPWW, 1993).⁷³

Santa Paula Creek facilities are located off the east side of Highway 150 approximately 3.5 miles north of Highway 126. Water is diverted to a 27-inch concrete pipe and flows by gravity into the 500,000 gallon Canyon Reservoir. From the Canyon Reservoir water either flows by gravity or is pumped by each irrigation customer.⁷⁴

On 17 February 1998, the City entered into a lease and agreement with the Canyon Irrigation Company concerning the operation, maintenance, and capacity rights of the Canyon Irrigation System and associated surface and groundwater rights. Per the terms of the agreement (City, 1998c), the City transferred: (1) its obligation to provide irrigation water service to the Canyon Irrigation System customers; (2) its financial obligation of implementing system maintenance and capital facilities replacement and repairs; (3) all real property and appurtenant facilities necessary for operation of the

⁷³ City of Santa Paula, Final 2010 UWMP Update (June 2011),

⁷⁴ City of Santa Paula, Final 2010 UWMP Update (June 2011),

system; and (4) groundwater rights to the Santa Paula Basin of 673 af. Additionally, the City leased the full capacity of the Canyon Irrigation System and the exclusive right to divert surface water sources flowing in the Santa Paula Creek to the Canyon Irrigation Company. In accordance with the lease and agreement, the City will purchase an annual average of 500 afy of surface water from Santa Paula Creek, (or, at the option of the Canyon Irrigation Company, water from other sources, which is surplus to the irrigation needs of its members), for a total of no less than 5,000 af over a 10-year period commencing 17 February 1998. During the subsequent 20-year period, the City has the right to continue to purchase an average of 500 afy of surplus water supplies. If available, the City may also purchase additional surplus water supplies beyond the 500 afy mentioned previously from the Canyon Irrigation Company throughout the next 30 years.⁷⁵

The City currently wheels the 500 afy of surface water from Santa Paula Creek to Farmers Irrigation Company, which uses the surface water in lieu of pumped groundwater, and the City gains 500 afy groundwater pumping credits in the Santa Paula Basin.⁷⁶

Recycled Water

Construction of the new Santa Paula Water Recycling Facility (WRF) was completed early 2010. The city of Santa Paula purchased the facility on May 1, 2015. The treatment capacity of the City WRF is 4.2 mgd, or 4,704 afy. The City WRF produces water that meets California Title 22 regulations for recycled water. At present, recycled water is available within the City of Santa Paula area however, there is no infrastructure. The 2010 UWMP estimated recycled water urban demand within the City (and adjacent areas) would be approximately 1,622 afy. The recycled water demand could be fully met with recycled water from the new WRF, as identified in **Table 13, Projected City of Santa Paula Recycled Water Demand (afy)**.

75 City of Santa Paula, Final 2010 UWMP Update (June 2011)..

76 City of Santa Paula, Final 2010 UWMP Update (June 2011).

Source: City of Santa Paula, Final 2010 UWMP Update (June 2011). Table 4-6.

Note: All values rounded to the nearest af.

^a Undetermined.

Additional recycled water demand may be generated by groundwater recharge, agricultural irrigation, and commercial/industrial recycled water use. The City has not yet prepared a recycled water master plan to evaluate potential users, demand, recharge feasibility, and economic feasibility within the City water service area. It is anticipated that the City would gradually develop a recycled water system to meet the objectives of identified recycled water demand.⁷⁷

The Judgment does not preclude the recharge of the Santa Paula Basin, and indeed includes provisions for potential recharge. According to the Judgment, such storage would require approval of the TAC, must not adversely impact the water quality of the Santa Paula Basin, and must not cause injury to any vested rights. In the event the storage of water causes the Santa Paula Basin to spill, the first water lost to the Santa Paula Basin is deemed to be the stored water. Furthermore, title is retained to water stored underground, and stored water (minus losses) may be pumped in addition to the approved pumping allocations, provided no injury is caused to any intervener or party to the Judgment. In other words, if the City recharged 1,000 afy to the basin, they would be entitled to pump an additional 1,000 afy above and beyond their stipulated allocation. The necessary infrastructure to implement this option is not currently in place. At a minimum, construction of a pump station and approximately 4 to 5 miles of pipeline would be necessary to transport the recycled water to recharge basins.⁷⁸

Currently there are no recycled water systems in the proposed Project vicinity. However, the 2012 Wastewater Master Plan has included West Area 2 to have a future wastewater flow of 0.082 million

⁷⁷ City of Santa Paula, Final 2010 UWMP Update (June 2011),

⁷⁸ City of Santa Paula, Final 2010 UWMP Update (June 2011),

gallons per day or 919 acre feet per year during average dry weather season.⁷⁹ The proposed Project includes an onsite recycled water distribution system to irrigate the greenbelt and other irrigation areas. This will allow the Santa Paula West Business Park to make use of recycled water when the City completes its planned recycled water plan and extends a line to the point of connection in the railroad right of way at Beckwith Road.⁸⁰

The proposed Specific Plan recycled water system would operate via a proposed 12-inch distribution main constructed in Telegraph Road, within the City limits. This terminus would become the main POC for the proposed Project. The proposed distribution system will be comprised of 6-inch mains from the POC of the City's recycled water system.

3.2 ANALYSIS OF WATER SUPPLY AND DEMAND

The available supplies and water demands for the City's service area were analyzed to assess its ability to satisfy demands during three scenarios: a normal water year, a single dry year, and multiple dry years.

This WSA/WSV addresses the City's water supply and demand as it relates to a variety of concerns including:

1. Information and data available from the City's 2010 UWMP Update,
2. Issues related to water supply reliability relating to nongroundwater sources (Santa Paula Creek, and State Water Project water),
3. Consideration of information available from the DWR's *State Water Project Final Delivery Capability Report July 2015*.

Table 14, Projected Supply Reliability by Source, illustrates the assumptions associated with projected supply reliability by source and is used in the following discussion of City water supply and demand scenarios as they relate to the proposed Project.

79 City of Santa Paula, *Wastewater System Master Plan* (June 2012)

80 City of Santa Paula, *Santa Paula West Business Park Specific Plan* (amended October 2016).

Average and Dry Year Water Supply and Demand

The following tables provide the City’s projected urban water supplies and demands in an average year, a single dry year, and multiple dry years.

Table 15, Supply and Demand Comparison—Average Year (afy), shows the City’s projected urban water supplies and demands in an average year.

Table 16, Supply and Demand Comparison—Single Dry Year (afy), shows the City’s projected urban water supplies and demands in a single dry year.

Table 17, Supply and Demand Comparison—Multiple Dry-Years (afy), shows CVWD’s projected urban water supplies and demand through 2035. According to the UWMP, the aquifer and other sources of supply are adequate for a single dry year and also multiple dry years, for a 20-year period.

Table 15
Supply and Demand Comparison—Average Year (afy)

Project Supply and Demand

The proposed Project will demand 39.8 afy at full build-out (see **Table 2**).

The allocated supply to West Area 2 per the 2010 UWMP Update is 88.8 afy.⁸¹ The estimated potable demand for the proposed Project is approximately 40.6 afy (20.5 afy for Commercial/Light Industrial use, 1.5 afy for Light Industrial use, and 17.8 afy for landscape irrigation). The potable demand of 22.0 afy for the Commercial/Light Industrial and Light Industrial uses is 25 percent of the West Area 2 total supply allocation. The landscaped areas will be irrigated using reclaimed water to be delivered from the City's wastewater treatment plant.

The Project will replace existing agricultural uses on the site. As such, water currently used for agricultural irrigation will be used instead for Project consumption. Currently agricultural uses on the Project Site use approximately 281.1 afy (average over the past 5 years; see **Table 3**). As such, the proposed Project's consumption will be a net reduction in total water use of 241.3 afy.

It should be noted that the West Area 2 Planning Area has been allocated a supply of 88.8 afy based on future development. The proposed Project could utilize a portion of this allocation. However, with the removal of the agricultural uses currently on the Project Site, the Project can use a portion of the existing water currently used for irrigation. It should be noted that that this portion of the pumped water will be pumped instead by the City from other wells, and not from the current well on site.

The Project will use reclaimed water (17.8 afy) that will be available from the City's wastewater treatment facility for irrigation; this will further reduce the demand on potable water supplies. The City forecast having between 400 afy (2015) and 1,622 afy (2035) of reclaimed water available for use (see **Table 13**). The Project will require only a portion of the recycled water (2.9 percent in 2017 and 1.1 percent in 2035).

As shown on **Table 18, Project Supply and Demand Comparison—Average Year (afy)**, shows the proposed Project water demand as a percent of total supply throughout various milestones in the build-out schedule. By 2027 (build-out), the Project is estimated to demand 39.8 afy of water. Water demand from the Project represents 0.81 percent of the City's total projected urban water demand in 2017, decreasing to 0.65 percent in 2037.

The 2010 UWMP Update projects total water demands for the Santa Paula Business Park through 2035 and demonstrates that supplies are sufficient to meet demands. The projected demand for the Project will account for only a small fraction of the projected demands.

81 City of Santa Paula, *Final UWMP Update* (June 2011), Table 204, p. 16. (1,906,000 square feet of development at 2.03 afy).

3.3 CONCLUSIONS

City of Santa Paula Service Area

Based on the information, analysis, and findings documented in this WSA/WSV, substantial evidence exists to support a determination that there will be sufficient water supplies to meet the current and future demands of the Project in addition to all forecasted demands for the 20-year period from initial development (2017 to 2037). This is based on the volume of water available in the Santa Paula Basin, and water rights and water supply contracts. The City has committed sufficient resources to further implement the primary elements of the 2010 UWMP Update, which include the purchase of additional water supplies, water conservation, and source substitution (use of agricultural irrigation water and reclaimed water).

The domestic water supply (potable) for the Project will be supplied by water from on-site water well pumping from the Santa Paula Basin that will ultimately be transferred to the City, encompassing the City of Santa Paula. Groundwater storage will be used in dry years to make up the difference between supply and demand. The Santa Paula groundwater basin has an “assumed initial yield” of the basin is 33,500 afy and currently contains about 26 million acre-feet and acts as a very large reservoir. It is capable of meeting the water demands of the City for extended normal and drought periods.

As discussed in the 2010 UWMP Update, and this WSA/WSV, the City of Santa Paula has many programs to eliminate overdraft and maximize the water resources recycled wastewater, and water conservation including water rates, landscaping ordinance, outreach and education.

The proposed Project falls within the boundaries of the West Area 2 Expansion Area. At 53.81 acres, the Santa Paula West Business Park Specific Plan would take up approximately 43 percent of the 125-acre planned expansion. The City’s General Plan projects a water demand of 88.8 afy for West Area 2. As such, the proposed Project has a projected demand of 39.8 afy, which is included in the General Plan.⁸² However, the Project will replace existing agricultural uses that extract well water from the Santa Paula Basin; as such, the Project will result in a net reduction (241.3 afy) of water use on site at build-out.

Currently, the entire potable water supply for the City is obtained by pumping from the Santa Paula Basin. The City has obtained additional groundwater pumping rights through a wheeling agreement with the Canyon Irrigation Company. The potential future water supplies include groundwater rights transfers to the City as new development occurs, City acquisition of potentially available groundwater allocations within the Santa Paula Basin, recycled water, and groundwater production from the Fillmore Basin.

82 City of Santa Paula, *Santa Paula West Business Park Specific Plan* (amended October 2016).

The SPBPA and TAC monitor current and future groundwater pumping within the Santa Paula Basin. The City is not limited to its allocation in any single year, but may produce as much as seven times its annual average allocations over a seven-year period. There are no restrictions regarding pumping in single dry- or multiple dry-water years subject to court order. As discussed earlier, the Santa Paula Basin Yield Study did not recommend that restrictions be imposed on the amount of groundwater that can be pumped during dry periods. Therefore, groundwater pumping by the City is not anticipated to be subject to any reductions in the dry year analysis.

Recycled water production will not be affected by single dry or multiple dry water years. Recycled water supply is directly related to wastewater generation, which is generally associated with indoor potable water use. Currently, there are no restrictions within the City regarding the use of potable water during dry periods. Additionally, the currently proposed uses of recycled water are restricted to non-potable irrigation that, if reduced during dry periods, would have little or no impact on the community. Therefore, it is not anticipated that the recycled water supply will be reduced during dry periods.

State Water Project dry-year restrictions are not known due to the lack of specificity regarding how the water will be delivered. For the purposes of this analysis, it is assumed that no State Water Project water will be delivered in the near future. However, the City may trade, transfer, and/or sell a portion of the SWP water rights to augment existing supplies.

Project Water Requirements

As shown in this WSA/WSV analysis, the projected demand for the proposed Project will account for only a small fraction of the total projected demands set forth in the City's General Plan, Land Use Element, for the total projected demands through 2037.

The proposed Project-specific water demand at build-out is 39.8 afy, which includes 22 afy of potable use and 17.8 afy for landscape irrigation that can be supplied with reclaimed water.

The proposed Project incorporates a number of features that reduce the overall water demand and provide for a reduction in use. As previously explained, it is assumed that Project water demand is included within the allowable West Area 2 supply and demand projections necessary to recharge the groundwater basin. In 2037, the proposed Project would utilize approximately 0.65 percent of the total City projected available water supply for 2037. As such, the proposed Project's demand is within the allowable demand necessary to manage the groundwater basin.

1.0 INTRODUCTION

1.1 PURPOSE

The City of Santa Paula (“City”) prepared this Final Environmental Impact Report (“Final EIR”) to evaluate the proposed Santa Paula West Business Park Specific Plan (“Specific Plan”), which is a comprehensive set of plans, exhibits, regulations, conditions, and programs for the orderly development of a portion of the West Area 2 Expansion Area (“West Area 2”) of the City of Santa Paula General Plan. The Specific Plan and off-site improvements proposed to support the development of the Specific Plan Area are collectively referred to as the “Project” in this Final EIR.

As the Lead Agency, the City prepared this Final EIR pursuant to the California Environmental Quality Act (CEQA; California Public Resources Code, Section 21000, et seq.) and in accordance with the *Guidelines for the Implementation of the California Environmental Quality Act* (“State CEQA Guidelines”; California Code of Regulations, Title 14, Section 15000, et seq.). The State CEQA Guidelines require the City to prepare an EIR for any project that may result in significant effects on the environment. Upon preliminary review, the City determined the Project may have significant effects on the environment; therefore, the City prepared a Draft EIR and circulated it for review in November 2016.

This Final EIR has been prepared pursuant to Section 15089 of the State CEQA Guidelines and incorporates the November 2016 Draft EIR by reference; comments on the Draft EIR received during the 45-day public comment period; written responses to those comments; and changes to the text of the Draft EIR. Because this Final EIR incorporates the Draft EIR by reference, a disc containing the Draft EIR is attached to this Final EIR on the inside back cover. The Draft EIR also may also be viewed electronically on the City’s website at <http://www.ci.santa-paula.ca.us/>.

1.2 ORGANIZATION OF THE FINAL EIR

As required by the State CEQA Guidelines Section 15132, this Final EIR includes of the following components:

- The Draft EIR or a revision of the draft (incorporated by reference);
- A list of persons, organizations, and public agencies commenting on the Draft EIR (see **Section 3.0: Comment Letters and Responses to Comments**);
- Comments and recommendations received on the Draft EIR (see **Section 3.0**);
- Responses to significant environmental points raised in the review and consultation process (see **Section 3.0**);
- Revisions to the Draft EIR (**Section 4.0: Revisions to the Draft EIR** and **Appendix A: Revisions to the Draft EIR—Utilities**); and

- Additional information is also provided, including a description of the public hearing (**Section 2.0: EIR Summary**).

1.3 ENVIRONMENTAL REVIEW PROCESS

On August 29, 2014, the City circulated a Notice of Preparation (NOP; State Clearinghouse Number No. 2014081104) of EIR for this Project for review and comment by the public and by responsible and reviewing agencies. The 30-day NOP review period ended on September 29, 2014. A scoping meeting was held on September 9, 2014, during the NOP review period, to provide an opportunity for comment on the potential environmental effects of the Project by the public and public agencies.

The purpose of public and agency review of the NOP is to assist in identifying potential environmental effects of the Project, and to assist the Lead Agency in:

1. Focusing the EIR on the effects determined to be potentially significant;
2. Identifying the effects determined not to be significant;
3. Explaining the reasons for determining that potentially significant effects would not be significant; and
4. Identifying whether a program EIR, tiering, or another appropriate process can be used for analysis of the Project's environmental effects.

During the 30-day NOP comment period, a total of 15 written comment letters were received from public agencies, private organizations, and individuals. The Draft EIR provided analysis of topics related to the potential environmental effects of the Project in accordance with CEQA.

The Draft EIR was released for a 45-day review period on November 4, 2016, which ended on December 19, 2016. On November 4, 2016, a Notice of Availability (NOA) of the Draft EIR for review was published in the City in the *Santa Paula Times*. A Notice of Completion (NOC) of the Draft EIR was also submitted on November 4, 2016 to the State Clearinghouse.

The Draft EIR provided analysis of the following topics:

- Aesthetics
- Agricultural Resources
- Air Quality
- Biological Resources
- Cultural Resources
- Geology and Soils
- Greenhouse Gases
- Hazards and Hazardous Waste
- Hydrology and Water Quality
- Land Use and Planning
- Noise
- Public Services
- Transportation and Traffic
- Utilities and Service Systems

The City accepted written comments on the Draft EIR by mail and in person to the City's Planning Department. The comments received by the City during the public review period are provided in this Final EIR, along with responses to comments.

This Final EIR for the Project is being distributed directly to all public agencies that submitted comments on the Draft EIR in accordance with Section 21092.5 of CEQA. The Final and Draft EIRs are also available for review at the following location:

City of Santa Paula
Planning Department
200 South 10th Street
Santa Paula, California 93060

In addition, the Final EIR and Draft EIR are available on the City's website at:

<http://www.ci.santa-paula.ca.us/>

Prior to considering approval of the Project, the State CEQA Guidelines require the City to certify that:

- The Final EIR was completed in compliance with CEQA;
- The Final EIR was presented to the City in a public meeting, and the City reviewed and considered the information contained in the Final EIR prior to considering the Project; and
- The Final EIR reflects the City's independent judgment and analysis (State CEQA Guidelines Section 15090).

In conjunction with certification of the Final EIR, the City must adopt one or more of the following written Findings of Fact for each significant environmental impact identified in the EIR:

- The Project was changed (including adoption of mitigation measures) to avoid or substantially reduce the magnitude of the impact;
- Changes to the Project are within another agency's jurisdiction and have been or should be adopted; or
- Specific considerations make mitigation measures or alternatives infeasible.

For impacts identified in the Final EIR as significant and unavoidable, the City is also required to adopt a Statement of Overriding Considerations identifying the specific social, economic, or other factors determined to outweigh the unavoidable adverse environmental effects of the Project.

2.0 EIR SUMMARY

This section provides information on the background of the Project assessed in the EIR and a summary of the information in the EIR identifying the potential environmental impacts of the Project, the measures identified to mitigate these impacts, and the alternatives evaluated to provide additional information on ways to avoid or lessen these impacts.

2.1 PROJECT OVERVIEW

The Santa Paula West Business Park Specific Plan (“Specific Plan”) is a proposed comprehensive set of plans, exhibits, regulations, conditions, and programs for the orderly development of a portion of the West Area 2 Expansion Area (“West Area 2”) as defined in the City of Santa Paula (“City”) General Plan. The Specific Plan and off-site improvements proposed to support the development of the Specific Plan Area are collectively referred to as the “Project” in this Final EIR.

The Specific Plan would guide future development on approximately 53.81 acres of the City’s 125-acre West Area 2 Expansion Area. West Area 2 was identified as an expansion area in the City’s 1998 General Plan to provide land needed for manufacturing, research and development, professional office, and limited commercial uses, with integrated vehicular circulation, pedestrian walkways, and infrastructure. The land uses envisioned within the Specific Plan will be a mix of low-intensity industrial (such as light manufacturing or research and development), professional offices, and supporting commercial businesses. These uses are allowed in the City’s Commercial/Light Industrial and Light Industrial zones.

The Specific Plan was prepared to implement the City’s General Plan for a portion of West Area 2 in accordance with the requirements of the California Government Code (Sections 65450–65457) and Chapter 16.216 of the City of Santa Paula Development Code. The Specific Plan would establish the regulations, programs, and procedures required to implement the General Plan goals and polices for this expansion area of the City. The Specific Plan would facilitate development within the Project Site as a master-planned business park that includes a variety of light industrial and commercial uses.

The Project includes the following discretionary actions:

- General Plan Amendment for the West Area 2 Expansion Area;
- Specific Plan Approval and Rezoning;
- Approval of the Master Vesting Tentative Map;
- Annexation to the City of Santa Paula;

- Encroachment permit by the California Department of Transportation for the construction of roadway and utility improvements in the State right-of-way; and
- California Public Utilities Commission approval for an at-grade crossing of the Ventura County Transportation Commission (VCTC) railroad.

2.2 PROJECT OBJECTIVES

The following Project objectives are based on the overall intent of the City's General Plan and the existing physical, environmental, demographic, and market conditions:

1. Help revitalize the existing built environment and economic climate of the City by permitting new investment and development in West Area 2 that reflects and complements the existing pattern and scale of development in Santa Paula;
2. Provide for light industrial and commercial uses that complement existing uses adjacent to the Project area; and
3. Provide suitable sites for light industrial and commercial buildings that meet the needs of the community but which are not presently available in the City of Santa Paula.

2.3 SUMMARY OF ENVIRONMENTAL IMPACTS AND MITIGATION MEASURES

A summary of the potential environmental impacts of the Project and the measures identified to mitigate those impacts is provided in **Table 2.0-1: Summary of Project Impacts**, for each topic addressed in the Draft EIR. **Table 2.0-1** was arranged into four columns: the identified impact under each EIR issue area; the level of significance prior to implementation of mitigation; mitigation measures that would avoid or reduce the level of impacts; and the level of significance after implementation of mitigation measures, if applicable. Compliance with existing City ordinances, programs, practices, and procedures is assumed for purposes of determining the level of significance prior to mitigation.

A summary of the alternatives to the Project to promote informed decision making follows **Table 2.0-1**.

**Table 2.0-1
Summary of Project Impacts**

Project Impacts	Impact without Mitigation	Mitigation Measures	Impact with Mitigation
Aesthetics			
<i>Threshold: Have a substantial adverse effect on a scenic vista?</i>			
Construction activities within the Project Site and off-site improvements, such as along Beckwith Road and Faulkner Road, could potentially be visible from State Route 126 (SR 126) and Telegraph Road and other vantage points that currently have views of these areas. Additionally, initial land development including, site clearing, grading, roadway construction, and improvements of the Project Site are anticipated to occur over approximately a 4-month period starting in sometime in 2019. For purposes of the analysis within this EIR, construction of individual buildings is assumed to occur over approximately 10 years in response to market conditions.	Potentially Significant	The impact is temporary and there are no feasible measures available to mitigate these temporary impacts.	Potentially Significant and Unavoidable on a Temporary Basis
The Project would provide for the development of commercial and light industrial uses, along with roadways and open space across the 53.81-acre Project Site. Building heights would be consistent with 1- to 2-story buildings having similar uses to the east of the Project Site, with a maximum building height of 35 feet and 45 feet for commercial/light industrial and industrial uses, respectively. Views of the agricultural fields from the SR 126 would be	Less than Significant	No mitigation measures required.	Less than Significant

Project Impacts	Impact without Mitigation	Mitigation Measures	Impact with Mitigation
<p>replaced with views of commercial and industrial uses related to the Project. Scenic aspects of the Project Site of the Project Site also include the agricultural lands and Adams Barranca west of the Site. While implementation of the Project would result in the loss of views of the existing agricultural lands in the immediate foreground with the addition of structures, circulation system, and supporting infrastructure, the urbanized appearance is similar to the adjacent uses. More distant scenic vistas of the Santa Clara River Valley would not be significantly altered upon the development of structures on the Project Site. Therefore, the Project would result in less than significant adverse impacts to scenic vistas.</p>			
<p>Threshold: Substantially damage scenic resources, including, but not limited to, trees, rock outcroppings, and historic buildings within a state scenic highway?</p>			
<p>The Project would incorporate various open space/passive uses into the Project design to preserve the visual quality of Adams Barranca, would not remove visually important trees or geologic features, and since the segment of SR 126 that is adjacent to the Project Site is not eligible for designation as a scenic highway, implementation of the Project would not damage scenic resources within a designated state scenic highway.</p>	<p>Less than Significant</p>	<p>No mitigation measures required.</p>	<p>Less than Significant</p>

Project Impacts	Impact without Mitigation	Mitigation Measures	Impact with Mitigation
Threshold: Substantially degrade the existing visual character or quality of the site and its surroundings?			
<p>The existing visual character and quality of the Project Site is predominantly agricultural in nature, with ancillary agricultural facilities, row crops, and orchards. Due to the Project Site’s relatively low and flat elevations, many off-site vantage points of the Project Site are obstructed by existing structures and buildings. However, development within the Project Site can be seen from vantage points that are located immediately adjacent to the Project Site, such as those along SR 126, Telegraph Road, Beckwith Road, Todd Lane, and Faulkner Road. Furthermore, while elevations of the Project Site would remain relatively flat and at low elevations, and although the Specific Plan development standards will be required to ensure a consistent and compatible aesthetic character with the developments to the east, the existing open space and agricultural character of the Project Site would substantially change. The altered views from the public viewpoints that immediately surround the Project Site are considered significant and unavoidable.</p>	Significant	No mitigation measures.	Significant and Unavoidable
Threshold: Create a new source of substantial light or glare which would adversely affect day or nighttime views of the area?			
<p>The Project’s development standards establish the types of materials that can be used for various types of structures on the Project Site; reflective, glare-producing materials are prohibited. Daytime sources of glare would include the sun reflecting off glass windows of structures and vehicles.</p>	Potentially Significant	AES-1: Before the City issues grading permits, the applicant must prepare and submit a Lighting Plan to the City of Santa Paula Planning Director for approval that identifies the types of shielding that will be used for outside lighting and must comply with all applicable dark sky ordinances/regulations.	Less than Significant

Project Impacts	Impact without Mitigation	Mitigation Measures	Impact with Mitigation
<p>Glare produced from these sources would be brief and intermittent. Therefore, impacts related to glare would be less than significant.</p> <p>The Project’s nighttime sources of light would include outdoor lights, such as mounted lights and lighted signs on the buildings, parking lot lighting, interior building lights, and headlights of vehicles. Given that minimal outdoor lighting is currently emitted from the Project Site, these impacts related to the additional nighttime light and glare from the Project are considered to be potentially significant.</p>		<p>All exterior night lighting installed on the Project Site shall be of low-intensity, low-glare design, and hooded to direct light directly downward onto the area being lighted to prevent spillover onto adjacent parcels. Shielding must be included to eliminate uplighting. Exterior lighting fixtures must be kept to the minimum number and intensity needed to ensure public safety. These lights shall be dimmed after 10:00 PM to the maximum extent practical without compromising safety. Upward directed exterior lighting is prohibited.</p>	
Cumulative Impacts			
<p>In combination with the Project, all of the proposed expansion areas would change the visual character of the area over time from a more rural setting to one with more urbanized development, especially along the main travel corridors, such as SR 126. The cumulative development would transform the visual character of the City by reducing the amount of open space within the City limits and expanding the urban visual character. However, implementation of the Project and related projects would be consistent with the City’s General Plan. While the Santa Paula West Business Park Specific Plan would include various open space and would not affect the Adams Barranca, the development would contribute (albeit to a lesser degree) to the cumulative changes in visual character of the City in combination</p>	<p>Significant</p>	<p>No mitigation measures.</p>	<p>Significant and Unavoidable</p>

Project Impacts	Impact without Mitigation	Mitigation Measures	Impact with Mitigation
<p>with the other relatively large scale related projects. Therefore, as with the Project, impacts related to the views and visual character of the City as a result of the Specific Plan amendment, are considered cumulatively considerable, and significant and unavoidable.</p>			
<p>Agricultural Resources</p>			
<p>Threshold: Convert Prime Farmland, Unique Farmland, or Farmland of Statewide Importance (Farmland), as shown on the maps prepared pursuant to the Farmland Mapping and Monitoring Program of the California Resources Agency, to non-agricultural use?</p>			
<p>According to the Farmland Mapping & Monitoring Program (FMMP) Important Farmland Map for the County of Ventura, there are approximately 44.22 acres of prime farmland and 4.88 acres of farmland of Statewide importance on the site (total of 49.1 acres). Implementation of the Specific Plan would result in the conversion of the 49.1 acres of both prime farmland and important farmland to urbanized uses.</p>	<p>Significant</p>	<p>AG-1: To reduce or minimize impacts to Prime Farmland, and Important Farmland, the Applicant shall provide mitigation through one, or some combination of, the following mitigation measures, prior to the issuance of a grading permit by the City:</p> <ol style="list-style-type: none"> 1. The Applicant shall secure a conservation easement in perpetuity, on land officially designated by the State of California as Prime Farmland and Important Farmland. The mitigation ratio shall be 1:1 for each class of designated farmland, resulting in a conservation easement being placed on a total of 44.20 acres of Prime Farmland, and 4.88 acres of Important Farmland, within the State of California. The applicant may satisfy the Important Farmland mitigation requirement by conserving Prime Farmland; or 2. The Applicant shall make payments to a local, regional, or Statewide organization whose purpose is to acquire agricultural conservation easements for Prime Farmland and Important Farmland and has demonstrated a successful track record in doing so, over at least 5 years. If the applicant elects to pursue this option alone, or in combination with option 1, the Applicant shall 	<p>Significant and Unavoidable</p>

Project Impacts	Impact without Mitigation	Mitigation Measures	Impact with Mitigation
		<p>demonstrate to the City Planning Director that it has paid funds sufficient to allow the state, regional, or local conservation organization to acquire conservation easements in perpetuity over Prime Farmland and important Farmland resulting in a mitigation conservation ratio or 1:1 for each class of Farmland.</p> <p>If, prior to the issuance of a grading permit, the Applicant contends that satisfying mitigation options 1 and/or 2 is not financially feasible, the Applicant shall provide substantial evidence to the City Planning Director, as that term is defined in the CEQA Guidelines, including but not limited to expert opinion evidence supported by facts, to support its contention that such mitigation is not financially feasible. The Applicant's substantial evidence shall be independently reviewed by the City's financial experts or outside consultant, the cost of which shall be paid by the Applicant. If the City concurs with the Applicant's conclusion that mitigation options 1 and or 2 are not financially feasible, the Applicant shall provide mitigation at less than a 1:1 ratio, to the extent feasible, to minimize or reduce the level of impacts to Prime Farmlands and important Farmland.</p>	
<p>Threshold: Conflict with existing zoning for agricultural use, or a Williamson Act contract?</p>			
<p>The County zoning designation for the Project area is Agricultural Exclusive (A-E) Urban Reserve for land currently in agricultural use. The Specific Plan area would be zoned Commercial/Light Industrial and Light Industrial in accordance with the Specific Plan's Zoning Implementation Plan and consistent with the City's Municipal Code for these designations. The development of a variety of manufacturing, research and development, office, and commercial uses that would be allowed under the Specific Plan</p>	<p>Less than Significant</p>	<p>No mitigation measures required.</p>	<p>Less than Significant</p>

Project Impacts	Impact without Mitigation	Mitigation Measures	Impact with Mitigation
<p>would be compatible with the proposed City's General Plan designations. There are no Williamson Act contracts preserving agricultural that govern any parcels within the Project area.</p>			
<p>Threshold: Conflict with existing zoning for, or cause rezoning of, forest land (as defined in Public Resources Code Section 12220 (g)), timberland (as defined by Public Resources Code Section 4526), or timberland zoned Timberland Production (as defined by Government Code Section 51104 (g))?</p>			
<p>The Project Site would be zoned C/LI (Commercial Light Industrial) and LI (Light Industrial) for areas that would be developed under the Specific Plan. The Adams Barranca and related detention basin used for flood control would be preserved with an Open Space/Passive zoning designation.</p> <p>The Project Site is not zoned as forestland or timberland, and there is no timberland production within the vicinity of the Proposed Project.</p>	<p>No Impacts</p>	<p>No mitigation measures required.</p>	<p>No Impacts</p>
<p>Threshold: Result in the loss of forestland or conversion of forestland to non-forest use?</p>			
<p>The Project does not include any loss of forestland or conversion of such forestland to any other designations.</p>	<p>No Impacts</p>	<p>No mitigation measures required.</p>	<p>No Impacts</p>
<p>Threshold: Involve other changes in the existing environment, which, due to their location or nature, could result in conversion of Farmland, to nonagricultural use or conversion of forestland to non-forest use?</p>			
<p>On-Site Agriculture</p> <p>As stated previously, approximately 49 acres of the 53.81-acre Project Site are under agricultural cultivation and would be taken out of production as a result of implementation of the Specific Plan.</p>	<p>Significant for On-Site Agriculture</p>	<p>Implementation of mitigation measure AG-1.</p>	<p>Significant and Unavoidable for On-Site Agriculture</p>

Project Impacts	Impact without Mitigation	Mitigation Measures	Impact with Mitigation
<p>Adjacent Agriculture</p> <p>Existing agricultural lands producing avocados, citrus fruits, and a variety of row crops are located south of the Specific Plan area, south of SR 126, and near the western boundary of the Specific Plan area, west of Adams Barranca. Agricultural operations to the south are separated from the Project Site by SR 126. The Specific Plan would not readily accommodate outdoor recreational activities for the general public or provide residential habitation components. As such, residential and general public exposure to dust, noise, and odors associated with nearby farming activities is considered less than significant. Therefore, based on the nature of the Project and design features to reduce any conflicts with adjacent agricultural land, potential impacts related to the conversion of off-site farmland to nonagricultural uses would be less than significant.</p>	<p>Less than Significant for Adjacent Agriculture</p>		<p>Less than Significant for Adjacent Agriculture</p>
<p>Cumulative Impacts</p>			
<p>Implementation of the General Plan would result in a long-term commitment to nonagricultural uses in areas that currently support prime and important Farmland, particularly within the West Area 2 and East Area 2 Expansion Areas. Since both of these expansion areas include Statewide important farmland, development of these areas in accordance with the General Plan will result in cumulative impacts to agricultural resources within the City's Planning Area. While development of these areas would be</p>	<p>Significant</p>	<p>Implementation of mitigation measure AG-1.</p>	<p>Significant and Unavoidable</p>

Project Impacts	Impact without Mitigation	Mitigation Measures	Impact with Mitigation
consistent with local planning policies, the cumulative impact on agricultural resources would be a significant and unavoidable impact.			
Air Quality			
Threshold: Conflict with or obstruct implementation of the applicable air quality plan?			
<p>According to the Ventura County Air Pollution Control District (VCAPCD) Guidelines, to be consistent with the South Coast Air Quality Management (SCAQMD) Air Quality Management Plan (AQMP), a project must conform to the local general plan and must not result in or contribute to an exceedance of the County's projected population growth forecast.</p> <p>The Project's addition of 1,510 employees would be consistent with the projections per Southern California Association of Governments (SCAG). The planned uses would also be consistent with the City's land use and zoning designation of the Project Site. As such, the Project would not conflict with the 2007 AQMP and, as such, would not jeopardize attainment of state and national ambient air quality standards in the County of Ventura.</p>	Less than Significant	No mitigation measures necessary.	Less than Significant
Threshold: Violate any air quality standard or contribute substantially to an existing or projected air quality violation?			
Construction			
The VCAPCD's 25 lb/day threshold for reactive organic gas (ROG) and nitrous oxide	Potentially Significant	AQ-1: During clearing, grading, earthmoving, or excavation operations, excessive fugitive dust emissions shall	Less than Significant

Project Impacts	Impact without Mitigation	Mitigation Measures	Impact with Mitigation
<p>(NOx) does not apply to construction emissions because such emissions are temporary. Emissions of toxic air contaminants (TACs) are localized, not regional, in nature; impacts related to construction activities would be limited to the area immediately surrounding the construction site within the Project area, and the VCAPCD does not recommend any thresholds of significance for their associated emissions. Instead, the VCAPCD bases the determination of significance on a consideration of the control measures to be implemented. If all appropriate emissions control measures recommended by the VCAPCD Guidelines are implemented for a project, then construction emissions are not considered significant. All construction activities would adhere to the VCAPCD Rule 50 for Opacity, Rule 51 for Nuisance, and Rule 55 for Fugitive Dust.</p>		<p>be controlled by regular watering or other dust-preventative measures using the following procedures, as specified by the VCAPCD (including without limitation, to VCAPCD Rule 50 (Opacity) and Rule 51 (Nuisance):</p> <ul style="list-style-type: none"> • On-site vehicle speed shall not to exceed 15 miles per hour (the Project Site will contain posted signs with the speed limit). • All on-site construction roads with vehicle traffic shall be watered as necessary to prevent excessive dust; • Streets adjacent to the Project reach shall be swept as needed to remove silt that may have accumulated from construction activities so as to prevent excessive amounts of dust. • All material excavated or graded shall be sufficiently watered to prevent excessive amounts of dust. Watering shall occur at least twice daily with complete coverage, preferably in the late morning and after work is done for the day. • All clearing, grading, earth moving, or excavation activities shall cease during periods of high winds (i.e., greater than 25 miles per hour averaged over one hour) so as to prevent excessive amounts of dust (contact the VCAPCD meteorologist for current information about average wind speeds). • All material transported off site shall be either sufficiently watered or securely covered to prevent excessive amounts of dust. • The area disturbed by clearing, grading, earth moving, or excavation operations shall be minimized to prevent excessive amounts of dust. 	

Project Impacts	Impact without Mitigation	Mitigation Measures	Impact with Mitigation
		<p>These control techniques shall be indicated on Project grading plans. The Applicant and/or its contractor shall be responsible for implementing these measures and compliance with this measure will be subject to periodic site inspections by the City.</p> <p>AQ-2: Project grading plans shall show that for the duration of construction, ozone precursor emissions from construction equipment vehicles must be controlled by maintaining equipment engines in good condition and in proper tune per manufacturer’s specifications, to the satisfaction of the City Engineer. Compliance with this measure will be subject to periodic inspections of construction equipment vehicles by the Public Works Department.</p> <p>AQ-3: All trucks that will haul excavated or graded material on site shall comply with California Vehicle Code Section 23114 with special attention to subsections 2311(b)(F), (e)(2) and (e)(4) as amended, regarding the prevention of such material spilling onto public streets and roads.</p> <p>AQ-4: A comprehensive Fugitive Dust Control Plan shall be developed by the Applicant and approved by the VCAPCD before the applicant commences grading and excavation operations. The Plan shall include all feasible, but environmentally safe, dust control methods. If a particular dust control method is determined or believed not to be feasible, or if it would conflict with other regulations, justification for not including the subject method shall be provided at the time the Fugitive Dust Control Plan is submitted to the VCAPCD. The Plan shall identify all fugitive dust sources, the means by which fugitive dust from each identified source will be minimized, and the schedule of frequency that each dust control method will be applied for each identified source.</p>	

Project Impacts	Impact without Mitigation	Mitigation Measures	Impact with Mitigation
		<p>AQ-5: The construction contractor shall adhere to VCAPCD Rule 74.2 (Architectural Coatings) for limiting volatile organic compounds from architectural coatings. This rule specifies architectural coatings storage, clean up, and labeling requirements.</p>	
Operations			
<p>The Project would generate average daily operational emissions that exceed the thresholds of significance recommended by the VCAPCD for ROG. Many of the measures that the VCAPCD recommends to reduce significant operational impacts are features of the Project. The off-site transportation demand management (TDM) fund is a mitigation measure that can be used by project proponents for projects and program that exceed the ROG and NOx significance thresholds. The City of Santa Paula utilizes this program to mitigate the significant air quality impacts of projects with its jurisdiction. While impacts will be reduced with mitigation, they will remain significant and unavoidable.</p>	Significant	<p>AQ-6: Use low emission water heaters for commercial water heating (Emissions reduction of 11 percent for ROG and 9.5 percent for NOx).</p> <p>AQ-7: Construct pedestrian and transit friendly facilities such as wider sidewalks, bus stops with passenger benches and shelters, and bikeways and/or lanes and bike racks. Sidewalks and bikeways should be landscaped with trees (an approximately 4 percent emissions reduction).</p> <p>AQ-8: Provide shuttle/minibus service between the Project commercial and industrial land uses and the Santa Paula downtown area during the lunchtime period (11:00 AM to 2:00 PM).</p>	Significant and Unavoidable
<p>Threshold: Result in a cumulatively considerable net increase of any criteria pollutant for which the project region is non-attainment under an applicable federal or State ambient air quality standard (including releasing emissions which exceed quantitative threshold for ozone precursors)?</p>			
According to the VCAPCD, if an individual project results in air emissions of criteria	Significant	AQ-12: The Applicant and/or its contractor must plant and maintain shade trees to reduce heat build-up on structures.	Significant and Unavoidable

Project Impacts	Impact without Mitigation	Mitigation Measures	Impact with Mitigation
<p>pollutants that exceed VCAPCD's recommended daily thresholds for project-specific impacts, then the project would also result in a cumulatively considerable net increase of these criteria pollutants. By applying VCAPCD's cumulative air quality impact methodology, implementation of the Project would result in an increase of ROG, an ozone precursor, and NOx, such that significant cumulative impacts would occur. Accordingly, cumulative impacts would be potentially significant.</p>		<p>AQ-13: The Applicant and/or its contractor shall prepare a TDM for review and approval by the City and VCAPCD, before the City issues building permits. The plan shall incorporate reasonable and feasible measures to reduce Project-related traffic and vehicle miles traveled. At minimum, the TDM Program shall include the following measures:</p> <ul style="list-style-type: none"> • Provision of connections to identified adjacent City or regional trails. • Provision of adequate way-finding features to direct pedestrians and bicyclists to nearby Project and City destinations, such as school, retail, and civic facilities. • Provision of adequate setbacks and design features such that the proposed future enhancement of commuter rail opportunities is not hindered by Project design. • Construction of pedestrian- and transit-friendly facilities such as wider sidewalks, bus stops with passenger benches and shelters, bikeways, or lanes. Sidewalks and bikeways should be landscaped with trees. • Perform a traffic light synchronization study on streets impacted by Project development to reduce vehicle queuing time. <p>The Project shall offset the increase in daily emission over the 25 pounds of reactive organic compounds and nitrogen oxides per day either through the purchase of emission offsets or through the in-lieu fees shall be paid to fund off-site TDM facilities or services, if such a program has been established at that time. These fees can reduce emissions from non-Project-generated motor vehicle trips by funding programs to promote ridesharing, public transit, and</p>	

Project Impacts	Impact without Mitigation	Mitigation Measures	Impact with Mitigation
		bicycling. The amount of this financial contribution should be calculated on a pro-rate basis as determined to be equitable by the VCAPCD, and in accordance with the VCAPCD Guidelines. These fees should be paid prior to the issuance of building permits by the County. The applicant shall demonstrate the availability of the offsets or contribution to fund off-site TDM services to the VCAPCD through a contract or other agreement with the offset source(s), which binds the reduction to the Project.	
Threshold: Expose sensitive receptors to substantial pollutant concentrations?			
All but one study area intersection is projected to operate at level of service (LOS) D or better. This intersection is a freeway ramp and there are no sensitive receptors located within close proximity so as to be affected by vehicle emissions at this intersection. The closest residence is located approximately 200 feet east of the freeway ramp. Consequently, the Project would not expose sensitive receptors to substantial pollutant concentrations, and impacts would be less than significant.	Less than Significant	No mitigation measures necessary.	Less than Significant
A health risk assessment (HRA) was prepared to determine whether diesel particulate emissions from construction within the Santa Paula West Specific Plan will cause significant impacts to nearby sensitive receptors. In comparison to the applicable 10 in 1 million threshold level, carcinogenic risks do not	Less than Significant	No mitigation measures necessary.	Less than Significant

Project Impacts	Impact without Mitigation	Mitigation Measures	Impact with Mitigation
exceed the level posing no significant risk. Therefore, impacts are less than significant.			
An evaluation of the potential noncarcinogenic effects was also conducted. Results of the analysis demonstrate that construction of the Project will not generate any significant air quality impacts with regards to emissions of toxic air contaminants.	Less than Significant	No mitigation measures necessary.	Less than Significant
Grading will include earth-moving activities during the grading phase that will cut soil and use as fill at the Project Site. These activities could be considered conducive to disturbing the <i>Coccidioides immitis</i> spores if they are present. The fungus is not likely to be found in soil that has been or is being cultivated and fertilized. Furthermore, the construction activities will be required to conform to Rule 403 to control fugitive dust, along with other rules, that will prevent significant dust. Use of enhanced dust control procedures such as continual soil wetting, use of supplemental binders, early paving, etc. can achieve a significant improvement in PM10 control efficiency. However, impacts related to exposure of people of Valley Fever during construction may be potentially significant.	Potentially Significant	<p>AQ-9: To the extent feasible, construction employees shall be hired from local populations, since it is more likely that they have been previously exposed to the fungus and are therefore immune. An individual is quite likely to be affected by valley fever if he or she lives in an area where the fungus is prevalent. A person (or animal) with a positive test has had a valley fever infection and has developed immunity to the fungus and therefore, will never contract valley fever again.</p> <p>AQ-10: During periods of high dust in the grading phase, crews must use respirators in accordance with California Department of Occupational Safety and Health regulations.</p> <p>AQ-11: The operator cab of area grading and construction Equipment must be enclosed and air-conditioned.</p>	Less than Significant
The uses allowed by the Santa Paula West Business Park Specific Plan do not include any operations that require amounts of hazardous materials that could pose a significant health risk. Accordingly, the Project will not result in a significant impact	Less than Significant	No mitigation measures necessary.	Less than Significant

Project Impacts	Impact without Mitigation	Mitigation Measures	Impact with Mitigation
with respect to use of hazardous materials during long-term operations.			
Threshold: Create objectionable odors affecting a substantial number of people?			
Commercial and light industrial uses are not typically associated with objectionable odor complaints. However, the types of industrial activities that would occur with the Project are not known at this time, but would be evaluated at the time that permits to construct and operate are applied for from the VCAPCD. Therefore, the potential impacts associated with objectionable odors will be less than significant.	Less than Significant	No mitigation measures necessary.	Less than Significant
Cumulative Impacts			
<p>The Project would not have a cumulatively considerable contribution to this impact with respect to conflicting with or obstructing the implementation of the applicable air quality plan.</p> <p>Cumulative development activity within the City of Santa Paula would continue to implement dust control and equipment emissions mitigation measures during construction in accordance with City practices. Consequently, cumulative development within the city is not expected to cause a significant impact associated with construction activities.</p> <p>However, because the County of Ventura is currently in nonattainment for ozone, related projects could exceed an air quality standard or contribute to an existing or projected air</p>	Significant	Implementation of mitigation measures AQ-6 through AQ-8 and AQ-12 through AQ-13 .	Significant and Unavoidable

Project Impacts	Impact without Mitigation	Mitigation Measures	Impact with Mitigation
quality exceedance. Therefore, the emissions generated by the Project would be cumulatively considerable and are a significant and unavoidable impact.			
Biological Resources			
Threshold: Have a substantial adverse effect, either directly or through habitat modifications, on any species identified as a candidate, sensitive, or special status species in local or regional plans, policies, or regulations, or by the California Department of Fish and Wildlife or US Fish and Wildlife Service?			
The Project includes the dedication of Open Space for the areas identified as Mixed Willow Riparian, and no development would occur within the Mixed Willow Riparian habitat area, potential impacts to vegetation communities are considered less than significant.	Less than Significant	No mitigation measures necessary.	Less than Significant
Southern California black walnut (<i>Juglans californica</i>) is the only special-status plant species that was documented or determined to have a high likelihood of occurring within the Project Site. A total of 19 individual trees are located along the perimeter of the Project Site, mainly along the southwest boundary within the riparian habitat of the Adams Barranca and along the SR 126 right-of-way along the southeast boundary of the Project Site, however, the Project does not currently propose to remove any of the 19 Southern California black walnut trees. Impacts to special-status plant species (e.g. black walnut) are considered potentially significant.	Potentially Significant	BR-1 Before issuance of a grading permit, the Applicant must identify on grading plans, the locations of any protected trees (such as the Southern California black walnut, <i>Juglans californica</i>) and must include a report pertaining to preserving the tree(s) that could be affected by the grading activity. The report shall be prepared by a tree expert and shall evaluate the Applicant's proposals for protected tree preservation, including avoiding grading, land movement, or other activity within the drip line of any protected tree. Prior to grading, the drip line must be fenced to prevent earthmoving equipment from inadvertently entering the drip line. In the event protected tree cannot be avoided, then the Applicant must provide a tree report in accordance with the City's Tree Protection Ordinance and must provide for the replacement or relocation of any protected trees that are to be removed, or would be subject to landmoving or grading within its drip line.	Less than Significant

Project Impacts	Impact without Mitigation	Mitigation Measures	Impact with Mitigation
<p>The southwestern willow flycatcher breeds in dense riparian habits along rivers and streams, and almost all southwestern flycatchers breeding habitat is within close proximity of water or saturated soils. The Project includes construction activity that could result in a temporary impact to the species if members are foraging or in the unlikely event they nest near the Project Site at the time of construction. Therefore, impacts are considered potentially significant.</p>	<p>Potentially Significant</p>	<p>BR-3 To avoid impacts to native nesting birds, the Applicant must retain a qualified biologist (with selection to be approved by the City) to conduct nest surveys in potential nesting habitat within the Project Site prior to construction or site preparation activities. Specifically, within 30 days of ground disturbance activities associated with construction or grading, a qualified biologist shall conduct weekly surveys to determine if active nests of bird species protected by the Migratory Bird Treaty Act (MBTA) or the California Fish and Wildlife Code are present in the construction zone or within 300 feet (500 feet for raptors) of the construction zone. Surveys for special-status bird species can be conducted concurrently with general nesting bird surveys. Because birds known to use the Project area nest during the late winter, breeding bird surveys shall be carried out both during the typical nesting/breeding season (mid-March through September) and in January and February. The surveys shall continue on a weekly basis, with the last survey being conducted no more than 3 days prior to initiation of clearance or construction work. If ground disturbance activities are delayed, then additional pre-construction surveys shall be conducted such that no more than 3 days shall have elapsed between the last survey and the commencement of ground disturbance activities. Surveys shall include examination of trees, shrubs, and the ground within grassland for nesting birds, as several bird species known to occur in the area and are shrub or ground nesters, including burrowing owl, California horned lark, and mourning dove. In addition, due to the potential for least Bell's vireo and southwest willow flycatcher to exist, protocol surveys should be completed prior to the start of construction.</p>	<p>Less than Significant</p>

Project Impacts	Impact without Mitigation	Mitigation Measures	Impact with Mitigation
		<p>BR-4 If active nests are found, clearing and construction activities within 300 feet of the nest (500 feet for raptors) shall be postponed or halted until the nest is vacated and juveniles have fledged, as determined by the qualified biologist, and there is no evidence of a second attempt at nesting. Limits of construction to avoid an active nest shall be established in the field with flagging, fencing, or other appropriate barriers, and construction personnel shall be instructed on the sensitivity of nest areas. The biologist shall serve as a construction monitor during those periods when construction activities would occur near active nest areas to ensure that no inadvertent impacts to these nests will occur. The results of the survey, and any avoidance measures taken, shall be submitted to the City of Santa Paula within 30 days of completion of the pre-construction surveys and construction monitoring to document compliance with applicable state and federal laws pertaining to the protection of native birds.</p>	
<p>The least Bell’s vireo was not observed during the Project surveys; however, Adams Barranca provides potential habitat for the species. Impacts are considered potentially significant in the unlikely event this species nests on site or in the immediate vicinity and is subject to disturbance from construction activity.</p>	<p>Potentially Significant</p>	<p>Implementation of mitigation measure BR-3 and BR-4.</p>	<p>Less than Significant</p>
<p>Although, the Pallid bat was not observed during the Project surveys, Adams Barranca provides foraging and roosting habitat for the species. Construction under the Specific Plan</p>	<p>Potentially Significant</p>	<p>BR-6 To avoid potential impacts to the Pallid bat (<i>Antrozous pallidus</i>) and the Hoary Bat (<i>Lasiurus cinereus</i>), the Applicant must retain a qualified biologist (with selection to be reviewed by the City) to conduct roosting bat surveys within the Specific Plan area prior to site preparation activities. Thirty days before ground disturbance activities</p>	<p>Less than Significant</p>

Project Impacts	Impact without Mitigation	Mitigation Measures	Impact with Mitigation
<p>could result in potentially significant impacts to pallid bats.</p> <p>The Hoary Bat was not observed during the Project Surveys, however, Adams Barranca provides foraging and roosting habitat for the species. This species is not expected to breed in Adams Barranca but may use the habitat for roosting, and the agricultural areas of Project Area for foraging.</p>		<p>associated with construction or grading, a qualified biologist shall conduct weekly surveys in accordance with standard protocols to determine if roosting western red bats are present in the construction zone or within 300 feet of the construction zone. Roosting bat surveys shall be carried out from March through September. Surveys for special-status bat species may be conducted concurrently with nesting bird surveys. The surveys shall continue on a weekly basis, with the last survey being conducted no more than 3 days prior to initiation of clearance or construction work. If ground disturbance activities are delayed, then additional pre-construction surveys shall be conducted such that no more than three days shall have elapsed between the last survey and the commencement of ground disturbance activities. Surveys shall include examination of trees and large shrubs in which this species is known to roost. Any bats found outside of the breeding season (May through August) shall be relocated by having a qualified biologist remove the bat from the roost. If roosting female bats are found with young during the breeding season (May through August) clearing and construction activities within 300 feet of the roost, shall be postponed or halted until the roost is vacated and juveniles have been weaned, as determined by the biologist. Limits of construction to avoid an active roost site shall be established in the field with flagging, fencing, or other appropriate barriers. Construction personnel shall be instructed on the sensitivity of nest areas. The biologist shall serve as a construction monitor during those periods when construction activities will occur near active roost areas to ensure that no inadvertent impacts on these roosts will occur. The results of the survey, and any avoidance measures taken, shall be submitted to the City of Santa Paula within 30 days of completion of the pre-construction surveys and construction monitoring to document compliance with</p>	

Project Impacts	Impact without Mitigation	Mitigation Measures	Impact with Mitigation
		applicable state and federal laws pertaining to the protection of these bat species.	
<p>The avocado orchard within the Project Site and the ecotone between the agricultural fields and Adams Barranca provides forging habitat for the American badgers, as they are most abundant in the drier, open stages of most shrub, forest, and herbaceous habitats with friable soils. Development under the Specific Plan could result in the loss of American badger habitat. Impacts are considered potentially significant.</p>	Potentially Significant	<p>BR-5 The Applicant shall retain a qualified biologist (approved by the City of Santa Paula) to survey the Project Site for the presence of the American badger no earlier than 1 day prior to any grading activity. In particular, the survey shall include an examination of the fallow agricultural field in the eastern portion of the site that will be impacted during project implementation.</p> <p>If American badger is located on site, potential loss of individual animals shall be mitigated through one of the following: (1) an on-site passive relocation program, through which badgers are excluded from occupied burrows by installation of a one-way door in burrow entrances, monitoring of the burrow for 1 week to confirm badger usage has been discontinued, and hand excavation and collapse of the burrow to prevent reoccupation; or (2) active trapping and relocation of badgers to suitable off-site habitat by a qualified biologist and in coordination with the California Department of Fish and Wildlife (CDFW), as approved by the City and CDFW.</p>	Less than Significant
<p>No active bird nests were observed at the time of survey; however, suitable nesting habitat is present within the avocado orchard, ornamental trees within the Project area, and adjacent trees to the Project Site and within Adams Barranca. However, impacts to nesting birds may be potentially significant.</p>	Potentially Significant	Implementation of mitigation measure BR-3 and BR-4.	Less than Significant

Project Impacts	Impact without Mitigation	Mitigation Measures	Impact with Mitigation
<p>Threshold: Have a substantial adverse effect on any riparian habitat or other sensitive natural community identified in local or regional plans, policies, regulations or by the California Department of Fish and Wildlife or US Fish and Wildlife Service?</p>			
<p>Development under the Specific Plan would require the removal of the agricultural drainage ditch that bisects the Project Site and is considered State Waters pursuant to the Fish and Wildlife Code and the Clean Water Act. Other state and federal jurisdictional waters (i.e., those within Adams Barranca) would be preserved through an Open Space dedication and the prohibition of construction activities within the Barranca. All Project impacts to United States (US) Army Corps of Engineers (ACOE) and CDFW jurisdictional areas are considered potentially significant, they would be mitigated to a less than significant level through the conditions imposed pursuant to the Project’s 404, 401, and 1602 permits/agreement as well as by mitigation measures imposed by this EIR.</p>	<p>Potentially Significant</p>	<p>BR-7 Before the issuance of a grading permit for areas that require state permits, the applicant shall coordinate with the CDFW to verify the impact to state-protected waters and associated vegetation on the Project Site. A Streambed Alteration Agreement (SAA) must be obtained, and mitigation measures recommended by the CDFW as part of the SAA shall be implemented. The SAA shall be provided to the City prior to issuance of a grading permit.</p> <p>The Applicant must mitigate for impacts to jurisdictional waters as administered by the CDFW jurisdiction by restoring habitats within those jurisdictions acceptable to the resource agency. Habitat must be mitigated onsite or within the same watershed, if feasible.</p> <ul style="list-style-type: none"> • The mitigation site(s) shall have been evaluated and selected on the basis of their suitability for use as riparian mitigation areas. • The mitigation area shall provide procedures to prepare soils in the mitigation area, provide detailed seeding/planting mixtures, provide seeding/planting methods, and other procedures that will be used for successful re-vegetation. • Impacts to jurisdictional waters shall be avoided to the extent feasible in the design phase of the Project. • Maintenance and monitoring requirements shall be established, including quarterly and annual monitoring reports to CDFW. <p>BR-8 Prior to the issuance of a grading permit for areas that require state or federal permits, the applicant and/or its contractor shall coordinate with the ACOE to verify the</p>	<p>Less than Significant</p>

Project Impacts	Impact without Mitigation	Mitigation Measures	Impact with Mitigation
		<p>impact to federally regulated waters on the Project Site. A Nationwide Permit (NWP) shall be obtained and mitigation measures recommended by the ACOE and National Marine Fisheries, as part of the NWP shall be implemented. The NWP shall be provided to the City prior to initiating construction of the bridge crossing Santa Paula Creek.</p> <p>Areas determined to be federally regulated by the ACOE shall also fall under the jurisdiction of the Regional Water Quality Control Board (RWQCB), and a Clean Water Act Section 401 Water Quality Certification (401 Certification) will be required from the RWQCB for impacts to those areas.</p> <p>BR-9 For impacts to Regional Board jurisdiction, the Applicant shall:</p> <ul style="list-style-type: none"> • Establish, reestablish, rehabilitate, and/or enhance a minimum of 1:1 mitigation-to-impact ratio) on site; or • Provide a one-time in-lieu fee to a Regional Board–approved mitigation bank and/or in-lieu fee program within the Santa Clara River Watershed (at a minimum 1:1 mitigation-to-impact ratio) to establish, re-establish, rehabilitate, and/or enhance a minimum of 1.27 acres of Regional Board jurisdiction; or • A combination of on-site and/or off-site compensatory mitigation options, as described above. <p>BR-10 As mitigation impacts to CDFW jurisdiction, the Applicant shall:</p> <ul style="list-style-type: none"> • Establish, reestablish, rehabilitate, and/or enhance a minimum of 1:1 mitigation-to-impact ratio acres of CDFW jurisdiction for loss of State Waters; or • Provide a one-time in-lieu fee to a CDFW-approved mitigation bank and/or in-lieu fee program within the 	

Project Impacts	Impact without Mitigation	Mitigation Measures	Impact with Mitigation
		<p>Santa Clara River Watershed (at a minimum 1:1 mitigation-to-impact ratio) to establish, re-establish, rehabilitate, and/or enhance a minimum of 1:1 CDFW jurisdiction area; or</p> <p>A combination of on-site and/or off-site compensatory mitigation options, as described above.</p>	
<p>The development of the Project Site would increase the number of nighttime light and glare sources on the site. Light and glare can “spill over” into adjacent open space areas, increasing the level of light currently experienced there. Nighttime light can disturb breeding and foraging behavior and can potentially alter foraging and breeding behavior of nocturnal birds, mammals, and invertebrates, which is considered a potentially significant impact. However, Section 4.6 of the Specific Plan for the proposed Project addresses lighting guidelines for the Project Site, including but not limited to, height of lighting, requirements for screened lighting, and submittal of a lighting plan to the police Chief or designee for approval prior to issuance of a building permit. Impacts from lighting and glare would be considered less than significant.</p>	Less than Significant	<p>No mitigation necessary.</p> <p>Implementation of mitigation AES-1 which includes the installation of low intensity, low-glare design, and hooded to direct light downward preventing spillover into adjacent areas would further reduce impact.</p>	Less than Significant
<p>Development under the Project can be expected to increase human activity near Adams Barranca, which could result in an increase in the frequency of human encroachment into the Barranca when compared to existing conditions. The Open</p>	Less than Significant	No mitigation necessary.	Less than Significant

Project Impacts	Impact without Mitigation	Mitigation Measures	Impact with Mitigation
<p>Space area designations of the Specific Plan, upland buffers from the riparian area and development under the Project, and the Project characteristics that would provide predominantly indoor daytime work areas would minimize any potential for increase human disturbance to the Adams Barranca. Therefore, indirect impacts from human encroachment would be less than significant.</p>			
<p>Invasive exotic species introduced as landscaping could be dispersed by stormwater, wind, or wildlife, or by various other means to natural habitats in the area, including Adams Barranca and other downstream water bodies, such as the Santa Clara River. Impacts from the introduction of invasive exotic landscape plants could be potentially significant.</p>	<p>Potentially Significant</p>	<p>BR-2 Before issuance of a grading permit for development within the Specific Plan area, a landscaping and irrigation plan must be prepared and must incorporate the planting of native vegetation and use of water conserving irrigation. The landscaping and irrigation plan must be prepared by a licensed landscape architect, and use native plant and tree species. The landscape and irrigation plan must be submitted to the City of Santa Paula Planning Department for review and approval.</p> <p>Nonnative plants or vegetation must be avoided in future development areas. The landscaping plans within common areas of development areas must include appropriate provisions to prevent other invasive plant species from colonizing remaining natural areas. These provisions must include the following: (a) review and screening of proposed plant palette and planting plans to identify and avoid the use of invasive species; (b) weed removal during the initial planting of landscaped areas; and (c) the monitoring for and removal of weeds and other invasive plant species as part of ongoing landscape maintenance activities. The frequency and method of monitoring for invasive species must be determined by a qualified botanist.</p> <p>For areas adjacent to Adams Barranca riparian corridors, the plan must provide for adequate landscaping to reduce</p>	<p>Less than Significant</p>

Project Impacts	Impact without Mitigation	Mitigation Measures	Impact with Mitigation
		indirect impacts including attenuation of noise and reduction of nighttime lighting and glare.	
The Project includes the dedication of Open Space for the areas identified as Mixed Willow Riparian, and no development would occur within the Mixed Willow Riparian habitat area, potential impacts to vegetation communities are considered less than significant.	Less than Significant	No mitigation measures necessary.	Less than Significant
The Specific Plan is designed to include stormwater infiltration and treatment. This includes low-impact development (LID) best management practices (BMPs) to ensure that the Project does not result in adverse effects to water quality in the Adams Barranca or the Santa Clara River. The Santa Paula West Business Park Specific Plan Drainage Master Plan will provide storm drains and runoff directed to an on-site detention basin for passive treatment of runoff from the Project driveways and other hard surfaces. Overall, the BMPs and the Project Design Features would address the anticipated and expected pollutants of concern from operation of the Project. Degradation of water quality from the Project would be managed in accordance with all applicable federal, state, and local water quality rules and regulations in order to effectively minimize the Project's impact on water quality. Accordingly, impacts would be less than significant.	Less than Significant	No mitigation necessary.	Less than Significant

Project Impacts	Impact without Mitigation	Mitigation Measures	Impact with Mitigation
Threshold: Have a substantial adverse effect on federally protected wetlands as defined by Section 404 of the Clean Water Act (including, but not limited to, marsh, vernal pool, coastal, etc.) through direct removal, filling, hydrological interruption, or other means?			
Alteration of state-protected waters and associated riparian vegetation would require the acquisition of a Fish and Wildlife Code Section 1602 SAA from the CDFW. Due to the high habitat value that drainages and swales are known to provide for wildlife and because these areas are under the jurisdiction of the CDFW, the proposed removal of these waters is considered a potentially significant impact.	Potentially Significant	Implementation of mitigation measures BR-7, BR-8, BR-9, and BR-10.	Less than Significant
Threshold: Interfere substantially with the movement of any native resident or migratory fish or wildlife species or with established native resident or migratory wildlife corridors, or impede the use of native wildlife nursery sites?			
Adams Barranca, located along the western border of the Project Site could provide a wildlife movement corridor with linkage between the foothills of the mountains north of the City and the Santa Clara River, however, the Project does not propose to obstruct or develop in the Barranca. The Project would not result in potentially significant impacts to the movement of resident or migratory fish or terrestrial wildlife species. No historical or active raptor nests or communal roosts exist at the Project Site or within 100 feet of any area that is or will be subject to development within the Project Site. Raptors are mobile species with generally large home ranges, they are capable of compensating for the loss of small acreages of foraging habitat in a local area by moving to other suitable foraging habitats. Therefore, development of the Project would not eliminate significant raptor foraging	Less than Significant	No mitigation necessary.	Less than Significant

Project Impacts	Impact without Mitigation	Mitigation Measures	Impact with Mitigation
<p>areas or limit raptors’ access to food resources, making potential impacts to raptors due to the development of the Project less than significant.</p>			
<p>Threshold: Conflict with the provisions of an adopted Habitat Conservation Plan, Natural Community Conservation Plan, or other approved local, regional, or state habitat conservation plan?</p>			
<p>The Project includes the dedication of approximately 4.9 acres (9.1 percent) of the Project Site as Open Space along the western boundary to preserve and provide a buffer area from the Adams Barranca. Therefore, the Project is consistent with the City General Plan Conservation and Open Space Element because it provides for the protection the City’s natural resources, and impacts would be less than significant.</p>	<p>Less than Significant</p>	<p>No mitigation necessary.</p>	<p>Less than Significant</p>
<p>The Project is consistent with the recovery plan for the least Bell’s vireo because the least Bell’s vireo habitat present on the site would not be impacted. The Project would result in potentially significant impacts to the least Bell’s vireo. However, mitigation measures are included within this EIR, and the Project would include an Open Space dedication along the western boundary to avoid impacts to habitat for least Bell’s vireo individuals in the Santa Clara River Watershed.</p>	<p>Potentially Significant</p>	<p>Implementation of mitigation measure BR-2.</p>	<p>Less than Significant</p>

Project Impacts	Impact without Mitigation	Mitigation Measures	Impact with Mitigation
<p>All potential impacts to the southwestern willow flycatcher during construction would be mitigated by measures included in this EIR, and the Project includes an Open Space dedication along the western boundary to avoid impacts to habitat for southwestern willow flycatcher individuals in the Santa Clara River Watershed. The southwestern willow flycatchers would not be permanently impacted, and therefore the Project is consistent with the recovery plan.</p>	<p>Potentially Significant</p>	<p>Implementation of mitigation measure BR-2.</p>	<p>Less than Significant</p>
<p>Cumulative Impacts</p>			
<p>Most wildlife species that could be expected to use the Project Site are species that are adapted to the disturbance that is caused by human-induced activities. Because of the present condition of the Project Site and the surrounding lands, it is unlikely that development of the site would contribute significantly to cumulative adverse impacts to regional flora and fauna. However, the loss of habitat associated with development of the Project area would contribute to the overall cumulative loss of biological resources in the Santa Paula region. Given that the impacted habitat within the Project area consists primarily of agricultural and urban developed land, and the impacted waters are small (less than 1 acre), the incremental contribution of the Project to this habitat loss is not cumulatively considerable.</p>	<p>Less than Significant</p>	<p>No mitigation necessary.</p>	<p>Less than Significant</p>

Project Impacts	Impact without Mitigation	Mitigation Measures	Impact with Mitigation
Cultural Resources			
<i>Threshold: Directly or indirectly destroy a unique paleontological resource or site or unique geologic feature?</i>			
While a majority of the Project Site consists of younger Holocene alluvial soils, older Pleistocene alluvial deposits are presumed to underlie these younger soils. Because these depths of older alluvial soils are unknown, there is a moderate to high potential for development-related earthmoving activities and unauthorized fossil collecting within older alluvium on the Project Site to result in the loss of scientifically important fossil remains, currently unrecorded fossil sites, and associated specimen data and corresponding geologic and geographic site data.	Potentially Significant	CUL-1: Should unexpected paleontological resources be discovered during any ground-disturbance activities greater than 10 feet below existing grade of Project Site, work in the immediate area of the discovery shall be halted and the City shall require an assessment by a qualified paleontologist to determine the significance of the find.	Less than Significant
The Project Site consists in majority of younger alluvial soils, which are considered to have low potential of containing significant paleontological resources. At shallow depths, the younger alluvium is considered too young to contain remains old enough to be considered fossilized. As a result of the unlikelihood of significant fossil resources being found within these younger soils, ground-disturbing activities of less than 10 feet below the current grade of the Project Site are anticipated to have low potential to impact any paleontological resources.	Potentially Significant	Implementation of mitigation measure CUL-1 .	Less than Significant

Project Impacts	Impact without Mitigation	Mitigation Measures	Impact with Mitigation
Threshold: Disturb any human remains, including those interred outside of formal cemeteries?			
<p>The nearest formal cemetery to the Project Site is the Pierce Brothers Santa Paula Cemetery, which is located approximately 1.4 miles northeast of the Site at 380 Cemetery Road. No known sites containing human remains exist within the Project area. However, currently unknown human remains potentially could be discovered during the construction of future projects within the Specific Plan. Project construction would require ground-disturbing activities, including grading and excavation, and the presence of construction equipment. These construction activities could potentially result in the discovery of previously unrecorded human remains, including Native American burials. Impacts related to construction would be limited to the construction area for each individual project within the Specific Plan.</p>	Potentially Significant	<p>CUL-2: In the event of a discovery of human bones, suspected human bones, or a burial, during ground-disturbing activities, all excavation in the vicinity must halt immediately and the area of the find protected until a qualified archaeologist determines whether the bone is human. If the qualified archaeologist determines the bones are human, the Ventura County Coroner must be notified before additional disturbance occurs. The construction contractor must ensure that the remains and vicinity of the find are protected against further disturbance until the Coroner has made a finding with regard to Public Resources Code (PRC) 5097 procedures, in compliance with Health and Safety Code Section 7050.5(b). If it is determined that the find is of Native American origin, the City will comply with the provisions of PRC Section 5097.98 regarding identification and involvement of the Native American Most Likely Descendant (MLD).</p>	Less than Significant
Threshold: Cause a substantial adverse change in the significance of an archaeological resource pursuant to Government Code Section 15064.5?			
<p>A majority of the Project Site has been extensively farmed with various row crops and orchards, which has continually disturbed the surface of the soils. While the Project Site does not contain any known sensitive archaeological resources within the disturbance area, the general Santa Clara River Valley is considered sensitive, and there is potential for unknown resources to be</p>	Potentially Significant	<p>CUL-3: In the event that previously unidentified archaeological resources are discovered during building construction, the contractor must cease work in the immediate area and the City Planning Director shall be contacted. An independent qualified archaeologist, retained by the City at the expense of the applicant, must assess the significance of the find and make mitigation recommendations, which shall be implemented to the extent feasible.</p>	Less than Significant

Project Impacts	Impact without Mitigation	Mitigation Measures	Impact with Mitigation
uncovered by activities, such as grading, that disturb the ground surface.			
Threshold: Cause a substantial adverse change in the significance of a historical resource as defined in Government Code Section 15064.5?			
The historic resource evaluation report concludes that while the development of the Project would result in an adverse impact by eliminating elements that contribute to a historic district, this impact would not cause a substantial change in the significance of the Santa Clara Valley rural historic district. Given the large size and complex nature of the historic district, the loss of a single employee residence and associated fields would not reduce the integrity of the historic district such that it could no longer convey historic significance. The Santa Clara Valley rural historic district would remain eligible for the National Register of Historic Places (NRHP) and the California Register of Historic Resources (CRHR). Therefore, the impact resulting from the Project would be less than significant.	Less than Significant	No mitigation necessary.	Less than Significant
Cumulative Impacts			
Other Specific Plan projects that would likely have similar potentially significant impacts to paleontological, archaeological, and historic resources include the remainder of West Area 2, Adams Canyon, Fagan Canyon, and the recently approved East Area 1 Specific Plan Amendment area. The Specific Plan, in combination with other currently planned projects, would result in the potential for a significant cumulative impact. Mitigation	Less than Significant	No mitigation necessary.	Less than Significant

Project Impacts	Impact without Mitigation	Mitigation Measures	Impact with Mitigation
measures would reduce the potentially significant cumulative contribution to paleontological, archaeological, and historical resources.			
Geology and Soils			
Threshold: Expose people or structures to potential substantial adverse effects, including the risk of loss, injury, or death involving:			
a. Rupture of a known earthquake fault, as delineated on the most recent Alquist-Priolo Earthquake Fault Zoning Map issue by the State Geologist for the area or based on other substantial evidence of known fault?			
The Specific Plan area is neither located within an established Alquist-Priolo Earthquake Fault Zone, nor is it crossed by a known active fault. The risk of loss, injury, or death associated with surface rupture of a known earthquake fault is considered very low, and impacts will be less than significant.	Less than Significant	No mitigation necessary.	Less than Significant
b. Strong seismic groundshaking?			
The Specific Plan area could be subject to strong ground shaking in the event of an earthquake originating along one of the nearby faults. Construction allowed by the Specific Plan will be required to comply with the version of the California Building Standards Code (CBC) in effect at the time individual building permits are obtained. The Project will not expose residents to unknown safety issues associated with seismicity (including ground shaking), and potential impacts are less than significant.	Less than Significant	No mitigation necessary.	Less than Significant

Project Impacts	Impact without Mitigation	Mitigation Measures	Impact with Mitigation
c. Seismic-related ground failure, including liquefaction?			
<p>Most of the Project Site lies within a liquefaction hazard zone, an area where the historic occurrence of liquefaction or groundwater conditions indicate a potential for ground displacements as a result of liquefaction, as designated by the State of California and the City of Santa Paula. Settlement caused by ground shaking is often not uniformly distributed, which can result in differential settlement. If settlement occurs, it could result in damage to improvements. Seismic settlement could occur on the site and is thus considered a potentially significant impact.</p>	Potentially Significant	<p>G-1: Additional explorations must be performed at the tentative tract map and grading plan review stages of the development planning. The purpose of the explorations would be to establish required removal depths and delineate any portion of the Project Site deemed susceptible to seismically induced settlement. The Project shall comply with all CBC/Uniform Building Code (UBC) requirements for seismic safety.</p>	Less than Significant
d. Landslides?			
<p>The topography of the project area is relatively flat and has no landforms where a landslide could form. Therefore, the potential for impacts from earthquake-induced landslides or other landslides (except lateral spread landslides) is considered less than significant.</p>	Less than Significant	No mitigation necessary.	Less than Significant
Threshold: Result in substantial soil erosion, or the loss of topsoil?			
<p>The native topsoil and alluvial soils in the annexation area may be moderately susceptible to erosion. Construction activities would comply with erosion control requirements, including existing grading and dust control measures, imposed by the City pursuant to grading permit regulations. After construction, the project may result in a</p>	Potentially Significant	<p>G-2: Detailed, design-level geotechnical investigation reports for all future subdivision and other discretionary development approvals must be submitted to the Public Works Director, or designee, for approval. In addition, grading plans and geotechnical reports prepared by a licensed Engineering Geologist (approved by the Public Works Director) must be provided to the Public Works Director, or designee, before the City issues grading building</p>	Less than Significant

Project Impacts	Impact without Mitigation	Mitigation Measures	Impact with Mitigation
<p>limited degree of soil erosion effects from vegetated areas. However, in accordance with National Pollutant Discharge Elimination System (NPDES) requirements, the project would be required to have a Standard Urban Stormwater Mitigation Plan (SUSMP) in place during the operational life of each development within the Specific Plan. While BMP design features would be developed with more refined engineering for each development prior to implementation of the above requirements, impacts associated with erosion and sedimentation are considered potentially significant.</p>		<p>permits for individual development projects within the Project Site. Requirements for the geotechnical reports and compliance are described below.</p> <ul style="list-style-type: none"> • The Engineering Geologist must make recommendations to address any seismically induced settlement within portions of the Project Site. In particular, seismically induced settlement must be addressed in the western parts of the Project Site, where preliminary geotechnical investigations determined that the area may experience up to several inches of seismically induced settlement in the event of strong ground motion. • The Engineering Geologist must inspect and certify that any expansive soils underlying individual building pads and all roadway subgrades have been either removed or amended in accordance with construction specifications, and make site-specific recommendations for grading, drainage installation, and foundation design, as appropriate. • The Public Works Director, or designee, must ensure that all soils and engineering report recommendations are incorporated into the project engineering and construction plans, including soils tests to ensure that it meets the soil classifications assumed in the soils reports, and that soils meet the CBC requirements. • All Project plans as determined necessary by the Public Works Director, or designee, including Grading and Construction Plans, must be reviewed and stamped by a Project soils engineer and submitted to the Public Works Director, or designee, for review and verification that all requirements are incorporated before the City issues grading or construction permits. 	

Project Impacts	Impact without Mitigation	Mitigation Measures	Impact with Mitigation
		<ul style="list-style-type: none"> The Applicant and/or contractor must retain a licensed soils engineer acceptable to the Public Works Director, or designee, to review all construction plans for consistency with the soils reports and to monitor on-site grading and construction to ensure the conditions at the Project Site do not substantially change the requirements of report recommendations for design-level geotechnical investigations. The project soils engineer must monitor grading and construction activity and report observations to the Public Works Director, or designee. The Public Works Director, or designee, will conduct field inspections as needed. 	
<p>Threshold: Be located on a geologic unit or soil that is unstable, or that would become unstable as a result of the project, and potentially result in on- or off-site landslide, lateral spreading, subsidence, liquefaction, or collapse; and be located on expansive soil, as defined in the Uniform Building Code, creating substantial risks to life or property?</p>			
<p>Expansive soils units may be found in the Qht deposits that could cause damage to foundations and walls due to repeated drying and wetting (shrink and swell). Therefore, geologic, soils, and geotechnical impacts would be potentially significant.</p>	<p>Potentially Significant</p>	<p>Implementation of mitigation measure G-2 and:</p> <p>G-3: The final grading and erosion control plan shall be designed to minimize erosion. The plan shall include, but not be limited to, the following:</p> <p>BMPs, such as temporary berms and sedimentation traps (such as silt fencing, straw bales, and sand bags), shall be installed in association with project grading. The BMPs shall be placed at the base of all cut/fill slopes and soil stockpile areas where potential erosion may occur and shall be maintained to ensure effectiveness. The sedimentation basins and traps shall be cleaned periodically, and the silt shall be removed and disposed of in a location approved by the City.</p> <p>Nonpaved areas shall be revegetated or restored (i.e. geotextile binding fabrics) immediately after grading and</p>	<p>Less than Significant</p>

Project Impacts	Impact without Mitigation	Mitigation Measures	Impact with Mitigation
		<p>installation of utilities to minimize erosion and to re-establish soil structure and fertility. Revegetation shall include drought-resistant, fast-growing vegetation that would quickly stabilize exposed ground surfaces. Alternative materials rather than reseeding (e.g., gravel) may be used, subject to review and approval by the City.</p> <p>Runoff shall not be directed across exposed slopes. All surface runoff shall be conveyed in accordance with the approved drainage plans.</p> <p>Energy dissipaters or similar devices shall be installed at the end of drainpipe outlets to minimize erosion during storm events.</p> <p>Grading shall occur during the dry season (April 15 to November 1) unless a City-approved erosion control plan is in place and all erosion control measures are in effect. Erosion control measures shall be identified on an erosion control plan and shall prevent runoff, erosion, siltation, and tracking of mud and soil onto City streets. All exposed graded surfaces shall be reseeded with ground cover vegetation to minimize erosion. Graded surfaces shall be reseeded within four (4) weeks of grading completion, with the exception of surfaces graded for the placement of structures. These surfaces shall be reseeded if construction of structures does not commence within four (4) weeks of grading completion.</p> <p>Site grading shall be completed such that permanent drainage away from foundations and slabs is provided and so that water shall not pond near proposed structures or pavements.</p>	
Cumulative Impacts			
At a minimum, all development occurring within the City of Santa Paula would be subject to CBC and construction standards	Less than Significant	No mitigation necessary.	Less than Significant

Project Impacts	Impact without Mitigation	Mitigation Measures	Impact with Mitigation
<p>relative to seismic and other geologic conditions that are prevalent within the region. Also, individual project geotechnical investigation reports, required prior to permit approval, would provide recommendations to account for site-specific design requirements to avoid subjecting on- and off-site properties to geologic hazards, in accordance with the CBC. With regard to erosion and sedimentation, development under the Santa Paula West Specific Plan and related projects are required to implement a stormwater pollution prevention plan (SWPPP) during construction, as required by the NPDES permit, to minimize impacts to off-site properties from the effects of erosion. The Project will meet the applicable standards and will sufficiently reduce its incremental cumulative geology and soil impacts to a less than significant cumulative impact.</p>			
Greenhouse Gasses			
Threshold: Generate greenhouse gas emissions, either directly or indirectly, that may have a significant impact on the environment?			
<p>All industrial land use projects that exceed 10,000 MTCO₂e per year would be considered potentially significant under the screening threshold. The estimated Project operational greenhouse gas (GHG) emissions with project design features would be 6,674.83 MTCO₂e per year, which would not exceed the screening threshold. In addition, the proposed Project would generate approximately 1,510 job opportunities and</p>	Less than Significant	No mitigation necessary.	Less than Significant

Project Impacts	Impact without Mitigation	Mitigation Measures	Impact with Mitigation
<p>would achieve a project-level efficiency target of 4.4 MTCO₂e per service population. This would be below the 4.8 MTCO₂e per service population threshold. Potential impacts would be less than significant based on the screening threshold.</p>			
<p>Threshold: Conflict with an applicable plan, policy or regulation adopted for the purpose of reducing the emissions of greenhouse gases?</p>			
<p>The Specific Plan would incorporate measures that reduce GHG emissions compared to a conventional project of similar size and scope. The Project would incorporate energy and water efficiency design features to enhance efficiency in all aspects of a building’s life cycle. These designs would increase the structures energy efficiency, water efficiency, and overall sustainability. These measures and features are consistent with existing recommendations to reduce GHG emissions. In addition, the Project would result in less than significant impact. Therefore, the Specific Plan would not conflict with the 2008 Scoping Plan and the 2014 Updated Scoping Plan.</p>	<p>Less than Significant</p>	<p>No mitigation necessary.</p>	<p>Less than Significant</p>
<p>Cumulative Impacts</p>			
<p>GHG emission reductions would be achieved through energy-efficient lighting and building design; installation of low-flow appliances; and water conservation. The methods used</p>	<p>Less than Significant</p>	<p>No mitigation necessary.</p>	<p>Less than Significant</p>

Project Impacts	Impact without Mitigation	Mitigation Measures	Impact with Mitigation
<p>to establish this relative reduction are consistent with the approach used in the CARB's Scoping Plan for the implementation of Assembly Bill (AB) 32 through 2020. The Project's features and GHG reduction measures make the Project consistent with the goals of AB 32. Therefore, the Project will result in a less than significant contribution to cumulatively significant GHG emissions.</p>			
<p>Hazards and Hazardous Materials</p>			
<p>Threshold: Create a significant hazard to the public or the environment through the routine transport, use, or disposal of hazardous materials?</p>			
<p>Construction of the Project would involve deliveries and disposal of hazardous materials such as fuels, oils, solvents, and other equipment maintenance and building materials. Spills or leakages encountered during construction and hauling would be temporary and would be required to be remediated in accordance with the State and local regulations for hazardous waste cleanup. As such, impacts from the use and handling of hazardous materials would be less than significant.</p>	<p>Less than Significant</p>	<p>No mitigation necessary.</p>	<p>Less than Significant</p>
<p>If the railroad is commissioned for service within the future, any transport of hazardous materials would comply with US Department of Transportation (USDOT) Federal Railroad Administration (FRA) safety regulations. Therefore, the probability of an accident involving the transport of hazardous materials within proximity to the Project Site</p>	<p>Less than Significant</p>	<p>No mitigation necessary.</p>	<p>Less than Significant</p>

Project Impacts	Impact without Mitigation	Mitigation Measures	Impact with Mitigation
is considered to be very low. Impacts would be less than significant.			
Threshold: Create a significant hazard to the public or the environment through reasonably foreseeable upset and accident conditions involving the release of hazardous materials into the environment?			
Construction			
<p>During construction of the Project, delivered materials to the site could contain hazardous materials, such as fuels, solvents, oils, coatings, etc. The event of a spill or release related to these hazardous materials could cause a short-term threat of exposure to nearby schools and residential areas along SR 126 and W. Telegraph Road. Therefore, the Project would have potentially significant impacts related to the transport of hazardous materials during construction activities.</p> <p>The Project Site has been historically used for agricultural uses for more than 75 years, it is possible that residual pesticides may be exposed during grading and excavation activities. The limited Phase II Environmental Site Assessment (ESA) conducted for the Project Site determined that exposure of residual pesticides is considered low. However, soil testing may not always indicate of every condition within the Project and clearing of existing debris or soils could uncover hazardous material contamination not previously known to occur on site. Therefore, potential impacts related to the presence of hazardous substances would be potentially significant.</p>	Potentially Significant	<p>HM-1: Prior to demolition and construction activities on the Project Site, the Applicant shall submit verification to the City of Santa Paula Building and Safety Department that an asbestos survey has been conducted on any buildings and irrigation pipelines that are to be demolished or removed from the Project Site. If asbestos is found, the Applicant shall follow all procedural requirements and regulations of the VCAPCD Rule 62.7 to properly dispose of all on-site ACM’s before general demolition activities commence.</p> <p>HM-2: Prior to demolition and any renovation activities on the Project Site, the Applicant shall submit verification to the City of Santa Paula Building and Safety Department that a lead-based paint survey has been conducted at all existing buildings located on the Project Site. If lead-based paint is found, the Applicant shall follow all Occupational Safety and Health Administration (OSHA) procedural requirements and regulations for its proper removal and disposal before general demolition activities commence.</p> <p>HM-3: Prior to disposal, all fluorescent light fixtures within the existing buildings shall be inspected for polychlorinated biphenyl (PCB) content labels throughout demolition of the Project Site.</p> <p>HM-4: Pole-mounted transformers, light ballasts, or other equipment suspected to contain PCBs must be inspected for the presence of PCBs prior to before any disturbance or removal. All equipment found to contain PCBs must be</p>	Less than Significant

Project Impacts	Impact without Mitigation	Mitigation Measures	Impact with Mitigation
		<p>removed and disposed in accordance with all applicable local, State and Federal regulations including but not limited to California Code of Regulations (CCR) Title 22, 40 Code of Federal Regulations (CFR) Part 261, and Environmental Protection Agency (EPA) 40 CFR. Utility Plans prepared as part of building permit review must include notes requiring inspection and plan for removal and disposal.</p> <p>HM-5: In the unlikely event that hazardous materials are encountered during grading or excavation activities anywhere on the Project Site, earthwork must be temporarily suspended in order to coordinate investigation/remediation efforts with the oversight of the Santa Paula Fire Department. An environmental professional (e.g. a professional geologist) is recommended to provide oversight and project monitoring to ensure the health and safety of all workers. A remedial plan consistent with federal and state remedial requirements, must be developed by a professional geologist approved by the City and submitted to the City Planning Director, or designee, for approval as required before continued work in the area.</p>	

Project Impacts	Impact without Mitigation	Mitigation Measures	Impact with Mitigation
Operations			
<p>The Project Site has historically been used for agricultural production. However, any new development occurring on any of these documented hazardous materials sites would have to be preceded by remediation and cleanup under the supervision of the State Department of Toxic Substances Control (DTSC) or other regulatory agency (as deemed appropriate) before construction activities could begin, if such actions have not already occurred. In addition, these listed areas are down gradient from the Project Site, so exposure to contaminants from migration through surface water or groundwater flow from the contaminated zones is not expected. Therefore, potential for contamination of the Project Site from off-site contamination sources is considered less than significant.</p>	Less than Significant	No mitigation necessary.	Less than Significant
<p><i>Threshold: Emit hazardous emissions or handle hazardous or acutely hazardous materials, substances, or waste within one-quarter mile of an existing or proposed school?</i></p>			
<p>The Project Site is not within 0.25 miles of an existing school. The Project may involve the use of hazardous materials on site typical of industrial-type uses. The storage and disposal of these hazardous materials on the Project Site would comply with City and Santa Paula Fire Department (SPFD) regulations and standards. Therefore, impacts would be less than significant.</p>	Less than Significant	No mitigation necessary.	Less than Significant

Project Impacts	Impact without Mitigation	Mitigation Measures	Impact with Mitigation
Threshold: Be located on a site which is included on a list of hazardous materials sites compiled pursuant to Government Code Section 65962.5 and, as a result, would it create a significant hazard to the public or the environment?			
<p>The Project Site contained two historical Aboveground Storage Tanks (ASTs) and one Underground Storage Tank (UST). These historical tanks have either been abandoned or removed from the Project Site as of 2005. Sources of contamination were identified within the areas of the ASTs and UST; however, these areas on the Project Site have been cleaned up and remediated and are not considered an environmental concern. Due to the regulatory status of hazardous materials incidents at the facility (e.g., closed case), the distance between the facility and the site, or the hydrogeologically cross-gradient location from the site, and given that site reconnaissance did not reveal the presence of hazardous chemicals, on-site impacts related to nearby hazardous materials sites are considered less than significant.</p>	Less than Significant	No mitigation necessary.	Less than Significant
Threshold: For a project located within an airport land use plan or, where such plan has not been adopted, within two miles of a public airport or public use airport, would the project result in a safety hazard for people residing or working in the project area?			
<p>The Specific Plan is not located within any of the three Safety Zones as established by the Ventura County Airport Land Use Commission (ALUC) within their Comprehensive Land Use Plan (CLUP). Therefore, the Specific Plan would not conflict with the requirements set forth in the Ventura County ALUC or the City's</p>	Less than Significant	No mitigation necessary.	Less than Significant

Project Impacts	Impact without Mitigation	Mitigation Measures	Impact with Mitigation
General Plan. Impacts would be less than significant.			
Threshold: For a project within the vicinity of a private airstrip, would the project result in a safety hazard for people residing or working in the project area?			
No portion of the Specific Plan is within a private airstrip other than the Santa Paula Airport. Implementation of the Project would result in less than significant impacts related to the exposure of employees or visitors to hazards from plane accidents due to the proximity of any private airstrips.	Less than Significant	No mitigation necessary.	Less than Significant
Threshold: Impair implementation of or physically interfere with an adopted emergency response plan or emergency evacuation plan?			
Construction activities of the Project may require the closure of vehicle travel lanes. The City's designated evacuation routes are along SR 126 and SR 150. While, SR 126 runs along the southern boundary of the Project Site, construction activities of the Project are not anticipated to interfere with access to the roadway or interfere with operation of the County's Hazard Mitigation Plan. Emergency access and potential traffic access impacts would be less than significant.	Less than Significant	No mitigation necessary.	Less than Significant

Project Impacts	Impact without Mitigation	Mitigation Measures	Impact with Mitigation
<p>The Specific Plan area has the potential for employees to encounter human-made and natural hazards, which could cause undue hardship to employees. The working population within the Specific Plan would be made aware of such disaster plans through public education and outreach activities. In addition, the Project would comply with the SPFD’s recommended standards for emergency accessibility and circulation. Thus, the Project’s operational impacts on the implementation of the Ventura County Hazard Mitigation Plan would be considered less than significant.</p>	<p>Less than Significant</p>	<p>No mitigation necessary.</p>	<p>Less than significant</p>
<p>Threshold: Increased fire hazard in areas with flammable brush?</p>			
<p>The Specific Plan is not located within a California Department of Forestry and Fire Protection (CAL FIRE) designated Local Responsibility Area (LRA) or State Responsibility Area (SRA). As the Project would not expose employees or visitors to any increased risks to fire hazards on the site, impacts are considered to be less than significant.</p>	<p>Less than Significant</p>	<p>No mitigation necessary.</p>	<p>Less than Significant</p>
<p>Cumulative Impacts</p>			
<p>Although each related project has potentially unique hazardous materials considerations, it is anticipated that all hazardous materials delivered and hazardous waste removed from the Specific Plan area and each related project would be in accordance with Title 24 of the Code of Federal Regulations.</p>	<p>Less than Significant</p>	<p>No mitigation necessary.</p>	<p>Less than Significant</p>

Project Impacts	Impact without Mitigation	Mitigation Measures	Impact with Mitigation
<p>Development of any projects would be required to comply with existing applicable laws and regulations pertaining to hazardous wastes, and the risk with identified hazardous material sites would be eliminated or reduced. Businesses would also be required to prepare a Hazardous Materials Business Plan (HMBP) including an annual inventory of hazardous materials used on site and submit a business emergency plan to the City for an annual review.</p> <p>Development under the Specific Plan would comply with all applicable laws and regulations related to the transport, use, treatment, storage, and disposal of hazardous materials and fire prevention.</p>			
Hydrology and Water Quality			
Threshold: Violate any water quality standards or waste discharge requirements?			
<p>Pollutants such as soil, sediments, and other substances associated with construction activities (e.g. oil, gasoline, grease, and surface litter) could be present in stormwater runoff from the site. Through compliance with the State Water Resources Control Board (SWRCB) and United States Environmental Protection Agency (USEPA) permits and SWPPP requirements, potential impacts to water quality during Project construction would be less than significant.</p>	Less than Significant	No mitigation necessary.	Less than Significant

Project Impacts	Impact without Mitigation	Mitigation Measures	Impact with Mitigation
<p>The development of the Project would increase the amount of impervious surfaces on the Project Site, which has the potential to increase runoff within the Project Site. The BMPs and the project design features would address the anticipated and expected pollutants of concern from operation of the Project. Degradation of water quality from the Project would be managed in accordance with all existing applicable federal, state, and local water quality rules and regulations to effectively minimize the Project's impact on water quality. Accordingly, impacts would be less than significant.</p>	Less than Significant	No mitigation necessary.	Less than Significant
<p><i>Threshold: Substantially deplete groundwater supplies or interfere substantially with groundwater recharge such that there would be a net deficit in aquifer volume or a lowering of the local groundwater table level (e.g., the production rate of pre-existing nearby wells would drop to a level which would not support existing land uses or planned uses for which permits have been granted)?</i></p>			
<p>The Project will not result in a significant new demand for water and will not substantially deplete groundwater supplies. In addition, the Project would use less water than the existing agricultural operations, and the Specific Plan would incorporate design features such as bioswales, bioretention cells, infiltration trenches and permeable pavement to allow surface water runoff percolation. Therefore, the Specific Plan would not substantially interfere with groundwater recharge. There will be no substantial impact to local groundwater recharge. Therefore, impacts would be less than significant.</p>	Less than Significant	No mitigation necessary.	Less than Significant

Project Impacts	Impact without Mitigation	Mitigation Measures	Impact with Mitigation
<p>Threshold: Substantially alter the existing drainage pattern of the site or area, including through the alteration of the course of a stream or river, in a manner which would result in substantial erosion or siltation on- or off-site?</p>			
<p>The Project does not alter the course of a stream or river, however site-clearing and grading operations have the potential for discharging sediment downstream during storm events. The Project would be required to develop a site-specific SWPPP in accordance with the NPDES Program General permits authorized under the Clean Water Act for Construction Activities. Adherence to the SWPPP and implementation of standard BMPs during construction would reduce the potential for increased siltation, erosion, and hazardous material spills. Through compliance with the SWPPP and standard BMPs, potential erosion and siltation, potential impacts will be less than significant.</p>	<p>Less than Significant</p>	<p>No mitigation necessary.</p>	<p>Less than Significant</p>
<p>The operation of the Specific Plan will contain a number of features to reduce the amount of runoff that will occur within the Specific Plan area, and limit the amount and rate of surface water flow downstream of the Specific Plan. The existing SR 126 culverts are exposed, but once the site is elevated by fill, the pipes would be underground and integrated into the new storm drain system. Peak flows would not exceed existing conditions, so there would not be adverse effects downstream. Therefore, potential impacts are considered less than significant.</p>	<p>Less than Significant</p>	<p>No mitigation necessary.</p>	<p>Less than Significant</p>

Project Impacts	Impact without Mitigation	Mitigation Measures	Impact with Mitigation
Threshold: Substantially alter the existing drainage pattern of the site or area, including through the alteration of the course of a stream or river, or substantially increase the rate or amount of surface runoff in a manner which would result in flooding on- or off-site?			
The Specific Plan would not substantially alter drainage patterns within the Project area, nor alter a stream or river. The storm drain system would collect on-site runoff and direct most of it to three separate detention basins prior to outletting into storm drains that connect to the existing culverts under SR 126. Peak flows would not exceed existing conditions, so there would not be adverse effects downstream. Therefore, impacts are considered less than significant.	Less than Significant	No mitigation necessary.	Less than Significant
Threshold: Create or contribute runoff water which would exceed the capacity of existing or planned stormwater drainage systems or provide substantial additional sources of polluted runoff?			
The Project incorporates detention basins sized to treat 10 percent of the Q50 (50-year storm event) from the storm drain system consistent with the Ventura County Storm Water Urban Impact Mitigation Plan (SQUIMP) guidelines. The proposed detention basins would be incorporated into the underground storm drain system, preventing any sedimentation to occur. Consequently, impacts related to water quality would be less than significant.	Less than Significant	No mitigation necessary.	Less than Significant
Threshold: Otherwise substantially degrade water quality?			
To reduce the discharge of expected pollutants during grading and other construction activities, such as sediment into receiving waters during construction, the Project Applicant will be required to prepare	Less than Significant	No mitigation necessary.	Less than Significant

Project Impacts	Impact without Mitigation	Mitigation Measures	Impact with Mitigation
<p>a SWPPP consistent with the Ventura County NPDES permit and the Technical Guidance Manual for Storm Water Quality Control Measures to minimize or eliminate the discharge of pollutants into receiving waters. The design features would comply with all NPDES permit requirements and no significant impacts to water quality will result.</p>			
<p>Threshold: Place housing within a 100-year flood hazard area as mapped on a federal Flood Hazard Boundary or Flood Insurance Rate Map or other flood hazard delineation map?</p>			
<p>The Specific Plan would not introduce new housing into the area. Therefore, impacts to housing within a 100-year flood hazard area would be considered less than significant.</p>	Less than Significant	No mitigation necessary.	Less than Significant
<p>Threshold: Place within a 100-year flood hazard area structures which would impede or redirect flood flows?</p>			
<p>The new channel design would have the capacity to handle flows that overtop the bank on the east side and the water that ponds due to the undersized culvert at SR 126. The channel also has a debris catchment area at the railroad bridge with a second culvert under the railroad bridge to accommodate peak flows rerouted due to the debris. A geotextile would be used in the channel to stabilize the soil for high velocities. Accordingly, impacts would be less than significant.</p>	Less than Significant	No mitigation necessary.	Less than Significant
<p>Threshold: Expose people or structures to a significant risk of loss, injury or death involving flooding, including flooding as a result of the failure of a levee or dam?</p>			
<p>The Specific Plan does not propose any residential land uses. Therefore, no new</p>	Less than Significant	No mitigation necessary.	Less than Significant

Project Impacts	Impact without Mitigation	Mitigation Measures	Impact with Mitigation
residential uses would be located in the flooding hazard zone. As such, impacts would be less than significant.			
Threshold: Inundation by seiche, tsunami, or mudflow?			
The Project Site is approximately 12 miles inland from the Pacific Ocean and is approximately 230 to 350 feet above mean sea level (amsl). There are no lakes, ponds, or dams adjacent to the Project Site. Therefore, the risk that the Project Site would be inundated by a seiche is considered negligible, and impacts associated with tsunamis or seiches would be less than significant. The proposed parallel channel and debris basin are incorporated into plans to improving the Adams Barranca. In addition, no on-site stormwater would be directed to the Adams Barranca. Therefore, impacts associated with mudflows would be less than significant.	Less than Significant	No mitigation necessary.	Less than Significant
Cumulative Impacts			
The Project would not contribute to a cumulatively significant hydrology or water quality impact. First, the Project does not alter any streams or rivers. Second, each related project would be required to comply with NPDES requirements and local regulations designed to prevent polluted runoff from entering local storm drain systems and receiving water bodies during construction and after development, the cumulative impact to water quality would be less than significant. Implementation of	Less than Significant	No mitigation necessary.	Less than Significant

Project Impacts	Impact without Mitigation	Mitigation Measures	Impact with Mitigation
<p>applicable City requirements, including the standards of the Ventura County SQUIMP, on all new development within the watershed would reduce cumulative impacts to area hydrology to a less than significant level. Additionally, the Project will not substantially deplete groundwater supplies or interfere substantially with groundwater recharge such that there would be a net deficit in aquifer volume of the local groundwater table level.</p>			
Land Use			
<i>Threshold: Physically divide an established community?</i>			
<p>The Project would not physically divide the existing community of Santa Paula or any smaller enclaves outside the City limits. The Project would not create incompatible land use relationships between the Project Site and existing off-site uses, and as a result of would not disrupt, divide, or isolate existing neighborhoods or communities. Therefore, impacts related to dividing an established community would be less than significant.</p>	Less than Significant	No mitigation necessary.	Less than Significant
<i>Threshold: Conflict with any applicable land use plan, policy, or regulation of an agency with jurisdiction over the project (including, but not limited to the general plan, specific plan, local coastal program, or zoning ordinance) adopted for the purpose of avoiding or mitigating an environmental effect?</i>			
<p>The Project would be consistent with the County of Ventura General Plan and Non-Coastal Zoning Ordinance, the Santa Paula General Plan and Santa Paula Municipal Code (SPMC), the 2016 SCAG Regional Transportation Plan/Sustainable Communities Strategy (RTP/SCS), and with</p>	Less than Significant	No mitigation necessary.	Less than Significant

Project Impacts	Impact without Mitigation	Mitigation Measures	Impact with Mitigation
<p>Ventura Local Agency Formation Commission (LAFCo) policies. Therefore, the project would not conflict with any applicable land use plan, policy, or regulation of an agency with jurisdiction over the project and impacts would be less than significant.</p>			
<p>Threshold: Conflict with any applicable habitat conservation plan or natural community conservation plan?</p>			
<p>The Specific Plan includes a dedication of Open Space/Passive uses over 4.9 acres that includes the Adams Barranca and buffer areas on the western portion of the Project Site. This dedication would preserve the habitat and natural community as envisioned in the City’s Open Space and Conservation Element of the General Plan. Therefore, impacts related to habitats conservation or natural community conservation plans would be less than significant.</p>	<p>Less than Significant</p>	<p>No mitigation necessary.</p>	<p>Less than Significant</p>
<p>Cumulative Impacts</p>			
<p>No significant cumulative land use impacts from future development within the expansion areas would result as these areas will be developed in accordance with the City’s General Plan. Additionally, environmental review will also be required and will be conducted prior to the adoption of future Specific Plans.</p>	<p>Less than Significant</p>	<p>No mitigation necessary.</p>	<p>Less than Significant</p>
<p>Noise</p>			

Project Impacts	Impact without Mitigation	Mitigation Measures	Impact with Mitigation
Threshold: Exposure of persons to or generation of noise levels in excess of standards established in the local general plan or noise ordinance, or applicable standards of other agencies?			
<p>Construction noise could exceed construction noise thresholds for the County with an increase of greater than 3 dB(A) at residences located within the agricultural operations to the west. There is a residence located near the northwest boundary of the Project Site within 75 feet that would be subject to construction noise in excess of 65 dB(A) for exterior areas. Therefore, construction noise impacts to residences to the west are considered potentially significant.</p>	Potentially Significant	<p>N-1: Stationary construction equipment, such as pumps, generators, or compressors, shall be placed as far from noise sensitive uses as feasible during all phases of project construction.</p> <p>N-2: All construction equipment shall be equipped with appropriate mufflers in good working condition.</p> <p>N-3: Before any site activity, the contractor shall be required to submit a material haul route plan to the City of Santa Paula and the County of Ventura for review and approval. The contractor shall ensure that the approved haul routes are used for all materials hauling, to minimize exposure of sensitive receivers to potential adverse noise levels from hauling operations.</p> <p>N-4: During all site preparation, grading and construction, the construction contractor shall locate all stockpiling and vehicle staging areas away from existing residences, to the extent feasible.</p>	Less than Significant
<p>An increase of 3 dB(A) or greater in traffic noise levels that occurs from Project-related activities would be considered significant if the resulting noise levels that occurs from Project-related activities would exceed the City Noise Compatibility Matrix for “acceptable” exterior or interior noise levels. These roadway systems will not experience an increase in noise levels of 3 dB(A) or greater. In addition, vehicle trips and traffic noise levels would remain the same with the proposed Beckwith Road extension and would not cause an increase of 3 dB(A) or</p>	Less than Significant	No mitigation necessary.	Less than Significant

Project Impacts	Impact without Mitigation	Mitigation Measures	Impact with Mitigation
greater due to Project-related activities. Therefore, the Santa Paula West Specific Plan Area would not result in significant noise impacts in the local and regional street system. Impacts along these roadway systems are considered less than significant.			
Predicted noise levels at 50 feet from the railway centerline to the southern boundary would be approximately 69.4 dB(A). Due to its proximity to the rail road track, uses allowed within the southern boundary of the Project Site are not sensitive to that estimate level.	Less than Significant	No mitigation necessary.	Less than Significant
Assuming noise levels at 69.4 dB(A) within 50 feet from the railway centerline, interior noise will be reduced to 44.4 dB(A), below the General Plan noise threshold of 45 dB(A), in compliance with City Building Code requirements. Therefore, potential interior noise within the proposed development would be considered less than significant.	Less than Significant	No mitigation necessary.	Less than Significant
Threshold: Exposure of persons to or generation of excessive groundborne vibration or groundborne noise levels?			
The surrounding land uses within 25 feet of the Project Site include the scattered residential uses immediately to the west. The construction near this portion of this site may include some earthwork and grading activities. While offsite surrounding land uses may experience vibration events, these would be temporary and would not be frequent and impacts would be considered less than significant.	Less than Significant	No mitigation necessary.	Less than Significant

Project Impacts	Impact without Mitigation	Mitigation Measures	Impact with Mitigation
Ground-borne vibration typically attenuates rapidly as a function of distance from the vibration source. Furthermore, the majority of the Project's operational-related vibration sources, such as mechanical and electrical equipment, would incorporate vibration attenuation mounts, as required by the particular equipment specifications. Therefore, operation of the Project Site would not increase the existing vibration levels at off-site surrounding uses; and as such, vibration impacts associated with operations would be less than significant.	Less than Significant	No mitigation necessary.	Less than Significant
Given vibration from the railroad track would not be constant and would be approximately 50 feet from the track, uses allowed within Santa Paula West Specific Plan Area would not be susceptible to these conditions. Therefore, impacts would be considered less than significant.	Less than Significant	No mitigation necessary.	Less than Significant
Threshold: A substantial permanent increase in ambient noise levels in the project vicinity above levels existing without the project?			
The noise that could be generated from within the Specific Plan area and mobile source noise impacts would not substantially increase the ambient noise conditions in the surrounding area. Any permanent increase in ambient noise levels is considered less than significant.	Less than Significant	No mitigation necessary.	Less than Significant
Threshold: A substantial temporary or periodic increase in ambient noise levels in the project vicinity above levels existing without the project?			
It takes a doubling of average daily trips on roadways to increase noise by 3 dB(A). The average daily trips associated with	Less than Significant	No mitigation necessary.	Less than Significant

Project Impacts	Impact without Mitigation	Mitigation Measures	Impact with Mitigation
<p>construction activities would not result in a doubling of trip volume along study-area roadways. Noise-level increases associated with construction vehicle trips along major arterials in the City of Santa Paula and nearby roadways that are within the area (unincorporated County of Ventura) would be less than 3 dB(A), and potential impacts will be less than significant.</p>			
<p>Threshold: For a project located within an airport land use plan or, where such a plan has not been adopted, within two miles of a public airport or public use airport, would the project expose people residing or working in the project area to excessive noise levels?</p>			
<p>Threshold: For a project within the vicinity of a private airstrip, would the project expose people residing or working in the project area to excessive noise levels?</p>			
<p>There are no commercial aircraft in operation at the airport. The general aircraft travel pattern is south of the City, with a required approach and departure altitude of 1,500 feet. Noise levels for the Airport, where most of the flight activities occur, are below 60 dB(A). Thus, people residing, attending school, or working within the future land uses of the Specific Plan area would not be exposed to excessive noise due to the aircraft travel pattern. Therefore, implementation of the Specific Plan would result in less than significant impacts related to noise generated by the Santa Paula Airport.</p>	<p>Less than Significant</p>	<p>No mitigation necessary.</p>	<p>Less than Significant</p>
<p>Cumulative Impacts</p>			
<p>All the stationary sources would be required to provide shielding or other noise-abatement measures so as not to cause a substantial increase in ambient noise levels. Moreover, due to distance, it is unlikely that</p>	<p>Less than Significant</p>	<p>No mitigation necessary.</p>	<p>Less than Significant</p>

Project Impacts	Impact without Mitigation	Mitigation Measures	Impact with Mitigation
noise from multiple cumulative projects would interact to create a significant combined noise impact. As such, it is not anticipated that a significant cumulative increase in permanent ambient noise levels would occur and, therefore, the impact would be less than significant.			
Public Services			
<i>Threshold: Result in substantial adverse impacts associated with the provision of new or physically altered governmental facilities, need for new or physically altered governmental facilities, the construction of which could cause significant environmental impacts, in order to maintain acceptable service ratios, response times or other performance objectives for any of the following public services:</i>			
<i>Fire Protection and Emergency Medical Services</i>			
<p>The Specific Plan will result in an increase in the need for services from existing Santa Paula Fire Department facilities, equipment, and staff personnel. No new facilities would be required to serve the Project Site as a result of the implementation of the Specific Plan. As such, mitigation is not required.</p> <p>The SPFD will review all future building plans and require adequate fire-flow pressure and flow rates through automatic fire sprinkler systems, fire hydrants, and other design features where appropriate (as required by appropriate federal, state, and local fire code and building code requirements. As such, potential impacts with regard to fire-flow requirements will be less than significant.</p>	Less than Significant	No mitigation necessary.	Less than Significant
<i>Police Services</i>			
Development of the Specific Plan would increase the demand for services and	Less than Significant	No mitigation necessary.	Less than Significant

Project Impacts	Impact without Mitigation	Mitigation Measures	Impact with Mitigation
resources provided by the Santa Paula Police Department. The Project would not require construction of new or expanded police protection facilities, project-related police protection impacts would be less than significant.			
Public Schools			
No new residential zoning or new residential development is proposed; the Project would not generate new housing with residents who would have a need for public school facilities. Therefore, the Project would not significantly impact the local school districts.	Less than Significant	No mitigation necessary.	Less than Significant
Parks and Recreation Facilities			
The Project does not include any new residential zoning or any new residential development projects, it would not result in an increase in the residential population that could visit the City's parks and recreation facilities. Project impacts would be less than significant.	Less than Significant	No mitigation necessary.	Less than Significant
Other Public Services			
Annexation of the Project area would shift all local government services to the City of Santa Paula. There would be increased demand for a variety of City resources, especially during the development planning, permitting, and inspection phases, and much less so thereafter. All services can be provided from the City's existing administrative facilities. No new governmental facilities would need to be constructed to administer governmental	Less than Significant	No mitigation necessary.	Less than Significant

Project Impacts	Impact without Mitigation	Mitigation Measures	Impact with Mitigation
services for the Project area, there would be no environmental impacts related to public facilities construction projects.			
Cumulative Impacts			
The City has regulations and ordinances in place to address impacts on public services (e.g., police, fire), including the provision and acquisition of new facilities and equipment. All planned development would be reviewed by the respective agencies and corresponding mitigation design features and payment of existing fees would be required prior to building permit issuance. Therefore, cumulative impacts associated with public services would be less than significant.	Less than Significant	No mitigation necessary.	Less than Significant
Transportation and Traffic			
Threshold: Conflict with an applicable plan, ordinance or policy establishing measures of effectiveness for the performance of the circulation system, taking into account all modes of transportation including mass transit and non-motorized travel and relevant components of the circulation system, including but not limited to intersections, streets, highways and freeways, pedestrian and bicycle paths, and mass transit?			
Existing with Project with Beckwith Road			
If Beckwith Road is extended south to Faulkner Road, 10 th Street and Harvard Boulevard intersection is forecast to operate at LOS D during the AM peak hour. The City of Santa Paula has defined the minimum desirable intersection level of service as LOS C, traffic generated by the proposed project would cause or contribute to significant traffic impacts at this intersection.	Significant	10th Street & Harvard Boulevard (Intersection 1). No feasible mitigation measures are available. A beautification project, including bicycle lanes, is planned along 10th Street at this location; therefore, widening of 10th Street to gain capacity was not considered as physically feasible mitigation. Given the constraints of the intersection and the proposed bicycle lanes, cumulative impacts to this intersection cannot be fully mitigated, and the impact would remain significant and unavoidable. Alternatively, a peak parking restriction on the southbound approach would allow for the reconfiguration of the southbound approach to include one	Significant and Unavoidable

Project Impacts	Impact without Mitigation	Mitigation Measures	Impact with Mitigation
		shared through/right-turn lane, one through lane (during peak hours), and one left-turn lane. The northbound approach could be restriped to provide one right-turn lane, one through lane, and one left-turn lane. In combination, these measures would result in an improvement from LOS C during the AM peak hour and LOS D during the PM peak hour to LOS A during the AM peak hour and LOS B during the PM peak hour, thus mitigating the increase in V/C ratio attributable to project traffic. However, due to the planned bicycle lanes, these improvements were not considered to be a feasible mitigation measure.	
If Beckwith Road is extended south to Faulkner Road, Peck Road and Harvard Boulevard/Telegraph Road/Main Street is forecast to operate at LOS D during the AM Peak hour. The City of Santa Paula has defined the minimum desirable intersection level of service as LOS C, traffic generated by the proposed project would cause or contribute to significant traffic impacts at this intersection.	Potentially Significant	<p>TRA-1 Peck Road & Harvard Boulevard/Telegraph Road/Main Street (Intersection 8).This intersection could be mitigated to LOS C or better with the addition of one travel lane to both the northbound and southbound approaches on Peck Road and the addition of a northbound right overlap phase. The northbound lane configuration would be one right-turn lane, two through lanes, and one left-turn lane. The northbound right-turn movement would also have an overlap signal head installed to accommodate the overlap phase. The southbound lane configuration would be one shared through/right-turn lane, one through lane, and one left-turn lane.</p> <p>Since this is a cumulative impact, the Project applicant shall be responsible for their fair share contribution for this mitigation improvement.</p>	Less than Significant
If Beckwith Road is extended south to Faulkner Road, Peck Road and SR 126 Eastbound On/Off Ramps/Acacia Way is expected to operate at LOS E during the PM peak hour. The City of Santa Paula has defined the minimum desirable intersection level of service as LOS C, traffic generated by	Potentially Significant	<p>TRA-2 Peck Road & SR 126 EB On/Off Ramps/Acacia Way (Intersection 10). This intersection could be mitigated to LOS C or better by installing a traffic signal. A peak-hour signal-warrant analysis is provided in Appendix D of the Traffic Impact Analysis and indicates that the installation of a traffic</p>	Less than Significant

<p>the proposed project would cause or contribute to significant traffic impacts at this intersection.</p>		<p>signal would be warranted under existing plus project conditions during the PM peak hour.</p> <p>Since this is a cumulative impact, the Project applicant would be responsible for their fair share contribution for this mitigation improvement.</p>	
<p>If Beckwith Road is extended south to Faulkner Road, Beckwith Road and Telegraph Road is expected to operate at LOS D during the PM Peak hour. The City of Santa Paula has defined the minimum desirable intersection level of service as LOS C, traffic generated by the proposed project would cause or contribute to significant traffic impacts at this intersection.</p>	<p>Potentially Significant</p>	<p>TRA-3 Beckwith Road & Telegraph Road (Intersection 12). This intersection could be mitigated to LOS C or better by installing a traffic signal and reconfiguring the westbound approach. A peak-hour signal-warrant analysis is provided in Appendix E and indicates that the installation of a traffic signal would be warranted under existing plus project conditions. The westbound approach can be restriped to provide one right-turn lane, one through lane, and one left-turn lane (a reconfiguration of the existing two-way left-turn lane). With the development of the Santa Paula West Business Park, Beckwith Road will be widened to full City standards, which provide for a 64-foot roadway within an 84-foot right-of-way. With the additional roadway width, the northbound approach could be widened from its current single-lane configuration to provide one left-turn lane and one shared through/right-turn lane. With this configuration as mitigation, the intersection would operate at LOS C or better under existing plus project conditions.</p> <p>Since the impacts at this intersection are project-related impacts (rather than cumulative impacts to which the project would contribute), the Project applicant shall be responsible for providing 100 percent of these mitigation improvements.</p>	<p>Less than Significant</p>
<p>Existing with Project without Beckwith Road</p>			
<p>If Beckwith Road is not extended south to Faulkner Road, Peck Road and Harvard</p>	<p>Potentially Significant</p>	<p>Implementation of mitigation measure TRA-1.</p>	<p>Less than Significant</p>

Project Impacts	Impact without Mitigation	Mitigation Measures	Impact with Mitigation
<p>Boulevard/Telegraph Road/Main Street would operate at LOS D during the AM Peak hour. Other Impacts with Project			
<p>The freeway segments currently operate at LOS C or better in both directions. Based on the significance threshold for the Los Angeles County CMP, the Project will not operate at</p>	Less than Significant	No mitigation necessary.	Less than Significant

Project Impacts	Impact without Mitigation	Mitigation Measures	Impact with Mitigation
LOS F after the addition of project traffic and the Project does not cause a net increase in traffic demand of 2 percent of capacity or more. Therefore, the Project would result in less than significant impacts to freeway and multilane segments.			
Threshold: Conflict with an applicable congestion management program, including, but not limited to level of service standards and travel demand measures or other standards established by the county congestion management agency for designated roads or highways?			
An analysis was completed to comply with the monitoring requirements found in the Ventura County Transportation Commission's (VCTC) 2009 Ventura County Congestion Management Program (VCCMP). The analysis indicated that these facilities would operate at LOS C or better during both peak hours under the Existing plus Project scenario and cumulative base plus project conditions in the year 2031. Therefore, impacts to the VCCMP would be less than significant.	Less than Significant	No mitigation necessary.	Less than Significant
Threshold: Result in a change in air traffic patterns, including either an increase in traffic levels or a change in location that results in substantial safety risks?			
The nearest airport is the Santa Paula Airport, located to the southeast of the Project Site. The Project Site is not located within any of the various safety zones established by the CLUP, nor is it within the Safety Zone, which includes the Inner Safety Zone (ISZ), the Outer Safety Zone (OSZ), and the Traffic Pattern Zone (TPZ), as provided in the City's General Plan Safety Element. Therefore, the	Less than Significant	No mitigation necessary.	Less than Significant

Project Impacts	Impact without Mitigation	Mitigation Measures	Impact with Mitigation
Project would result in a less than significant impact to air traffic patterns or safety risks.			
Threshold: Substantially increase hazards due to a design feature (e.g., sharp curves or dangerous intersections) or incompatible uses (e.g., farm equipment)?			
The internal circulation network would be constructed in compliance with the Santa Paula Municipal Code and would not contain dangerous design features (e.g., sharp curves, dangerous intersections) and would be designed to accommodate traffic of the Project, including any delivery trucks related other commercial vehicles related to the uses allowed under the Specific Plan. Implementation of the Project would result in less than significant impacts related to roadway design features and incompatible uses.	Less than Significant	No mitigation necessary.	Less than Significant
Threshold: Result in inadequate emergency access?			
No changes are proposed that would impact emergency access. In addition, as required by the City's Fire Code all individual building permit applications will include a review by the SPFD to ensure adequate setbacks between structures are maintained and that all sides of a building can be accessed by emergency personnel and emergency equipment. Impacts with regard to emergency accessibility would be less than significant.	Less than Significant	No mitigation necessary.	Less than Significant

Project Impacts	Impact without Mitigation	Mitigation Measures	Impact with Mitigation
Threshold: Conflict with adopted policies, plan, or program regarding public transit, bicycle, or pedestrian facilities, or otherwise decrease the performance or safety of such facilities?			
The City's General Plan includes goals to ensure that City residents have alternative transportation opportunities, such as public transit, bikeways, and pedestrian routes. Therefore, impacts to public transit, bicycle, or pedestrian facilities would be less than significant.	Less than Significant	No mitigation necessary.	Less than Significant
Cumulative Impacts			
Cumulative Base Conditions			
Under future conditions without the Project, 10th Street and Harvard Boulevard is expected to operate at LOS E during the AM Peak hour and LOS F during the PM Peak hour. The City of Santa Paula has defined the minimum desirable intersection level of service as LOS C. Traffic generated from future conditions without the Project would cause or contribute to significant traffic impacts at this intersection.	Significant	10th Street & Harvard Boulevard (Intersection 1). No feasible mitigation measures are available. A beautification project, including bicycle lanes, is planned along 10th Street at this location; therefore, widening of 10th Street to gain capacity was not considered as a physically feasible mitigation. Given the constraints of the intersection and the proposed bicycle lanes, cumulative impacts to this intersection cannot be fully mitigated, and the impact would remain significant and unavoidable. Alternatively, a peak parking restriction on the southbound approach would allow for the reconfiguration of the southbound approach to include one shared through/right-turn lane, one through lane (during peak hours), and one left-turn lane. The northbound approach could be restriped to provide one right-turn lane, one through lane, and one left-turn lane. In combination, these measures would result in an improvement from LOS C during the AM peak hour and LOS D during the PM peak hour to LOS A during the AM peak hour and LOS B during the PM peak hour, thus mitigating the increase in V/C ratio attributable to project traffic. However, due to the planned bicycle lanes, these improvements were not considered to be a feasible mitigation measure.	Significant and Unavoidable

Project Impacts	Impact without Mitigation	Mitigation Measures	Impact with Mitigation
Santa Paula has defined the minimum desirable intersection level of service as LOS C. Traffic generated by the proposed project would cause or contribute to significant traffic impacts at this intersection.			
Under future conditions with the Project, and if Beckwith Road is not extended south to Faulkner Road, Beckwith Road and Telegraph Road would operate at LOS E during the PM Peak hour. The City of Santa Paula has defined the minimum desirable intersection level of service as LOS C. Traffic generated by the proposed project would cause or contribute to significant traffic impacts at this intersection.	Potentially Significant	Implementation of mitigation measure TRA-3 .	Less than Significant
Other Cumulative			
Of the 10 directional freeway segments selected for analysis, all are projected to operate at LOS E or better during both the AM and PM peak hours under cumulative base conditions. As defined in the VCCMP, the minimum desirable level of service on freeway segments is LOS E. Therefore, no freeway segments would be significantly impacted due to cumulative development.	Less than Significant	No mitigation necessary.	Less than Significant
Utilities			
Threshold: Exceed wastewater treatment requirements of the applicable Regional Water Quality Control Board?			
Development of the Project will result in the removal of the existing septic tanks that currently serve the site. Once developed and occupied, uses within the Specific Plan area	Less than Significant	No mitigation necessary.	Less than Significant

Project Impacts	Impact without Mitigation	Mitigation Measures	Impact with Mitigation
<p>will generate wastewater that will be connected to the City’s sewer system and conveyed through a series of pipelines to the water recycling facility (WRF) for treatment. Effluent from the treatment plant must comply with the SPMC to meet the requirements of the Waste Discharge Requirements (WDR) permit issued to the City by the Los Angeles RWQCB.</p> <p>The treated effluent from the Project will not exceed applicable requirements, and the Project’s potential impacts related to wastewater treatment are less than significant.</p>			
<p>Threshold: Require or result in the construction of new water or wastewater treatment facilities or expansion of existing facilities, the construction of which could cause significant environmental effects?</p>			
<p>Water and recycled water pipeline construction impacts would be less than significant because they would be required to comply with the City’s noise ordinance, construction traffic management plan, requirements to cease construction should cultural resources be uncovered, and restrictions to avoid underground pipelines during excavation. In addition, no new or increased severity of impacts would occur as a result of the Project.</p>	<p>Less than Significant</p>	<p>No mitigation necessary.</p>	<p>Less than Significant</p>
<p>The new WRF has a normal operating capacity of 3.15 mgd, with a final build-out capacity of 4.2 mgd and a peak operating capacity of 7.0 mgd. The City is currently generating approximately 2.0 mgd, so there is unused capacity at the facility to accept the</p>	<p>Less than Significant</p>	<p>No mitigation necessary.</p>	<p>Less than Significant</p>

Project Impacts	Impact without Mitigation	Mitigation Measures	Impact with Mitigation
<p>incremental addition of 0.026 mgd that is anticipated from occupancy of the Specific Plan area. Therefore, the Project would have less than significant impacts to wastewater treatment capacity within the City.</p>			
<p>Threshold: Result in a determination by the wastewater treatment provider which serves or may serve the project that it has adequate capacity to serve the project's projected demand in addition to the provider's existing commitments?</p>			
<p>As concluded in the Sanitary Sewer Technical Report, the Project Site sewer system will be in accordance with the City of Santa Paula design guidelines. The Santa Paula West sewer system is in agreement with the design flows anticipated within the City's Wastewater Master Plan for this development. Also, the main backbone, will have additional capacity before reaching 50% pipe utilization of 253 gpm (0.564 cfs) for future connections and therefore there would be no impacts.</p>	Less than Significant	No mitigation necessary.	Less than Significant
<p>Threshold: Require or result in the construction of new storm water drainage facilities or expansion of existing facilities, the construction of which could cause significant environmental effects?</p>			
<p>The storm drain system would collect on-site runoff and direct most of it to three separate detention basins prior to outletting into storm drains that connect to the existing culverts under SR 126. The existing SR 126 culverts are exposed, but once the site is elevated by fill, the pipes would be underground and integrated into the new storm drain system. Peak flows would not exceed existing conditions, so there would not be adverse effects downstream. The detention basins will significantly reduce</p>	Less than Significant	No mitigation necessary.	Less than Significant

Project Impacts	Impact without Mitigation	Mitigation Measures	Impact with Mitigation
<p>peak runoffs downstream by storing the peak event flows and lagging their release after the storm peak. The Project's proposed design features and drainage plan would not result in an increase in stormwater runoff from the site or exceed stormwater drainage requirements established by the ACOE, Ventura County Waterworks District (VCWWD), or City. Impacts would be less than significant.</p>			
<p>Threshold: Have sufficient water supplies available to serve the project from existing entitlements and resources, or are new or expanded entitlements needed?</p>			
<p>Water demand from the Project represents 0.81 percent of City's total projected urban water demand in 2017, and decreasing to 0.65 percent in 2037.</p> <p>The 2010 Urban Water Management Plan (UWMP) Update projects total water demands for the Santa Paula Business Park through 2035 and demonstrates that supplies are sufficient to meet demands. The projected demand for the Project will account for only a small fraction of the projected demands. Therefore, there would be no impacts to available water supplies and no new or expanded entitlements are needed.</p>	<p>Less than Significant</p>	<p>No mitigation necessary.</p>	<p>Less than Significant</p>
<p>Threshold: Be served by a landfill with sufficient permitted capacity to accommodate the project's solid waste disposal needs? Threshold: Comply with federal, state, and local statutes and regulations related to solid waste?</p>			
<p>As provided by the SPMC, Section 50.140, Construction and Demolition Diversion, demolition and construction must divert 50</p>	<p>Potentially Significant</p>	<p>SW-1 Before issuance of a demolition permit or construction permit, the applicant must implement waste reduction and recycling programs to divert construction solid</p>	<p>Less than Significant</p>

Project Impacts	Impact without Mitigation	Mitigation Measures	Impact with Mitigation
<p>percent of waste tonnage from landfills. Separate calculations and reports are required for the demolition and construction portion of projects involving both activities. Impacts related to construction solid waste generation are considered potentially significant.</p>		<p>waste from the area landfill. A construction recycling plan must be submitted and approved by the Director of Public Works. A final report as to the amount recycled must be provided to the Director of Public Works at the completion of construction activities documenting the waste reduction efforts conducted, including a listing of solid waste diversion amounts, and the amount of waste sent to landfills. The report must also document how the construction contractor complied with applicable state and local statutes and regulations to reduce and recycle solid waste generated during construction.</p>	
<p>The proposed Project would account for less than 1 percent of the Toland Road Landfill permitted daily capacity. Additionally, the Project would account for less than 1 percent of the maximum permitted daily capacity for Chiquita Canyon Sanitary Landfill and Simi Valley Landfill & Recycling Center. However, the Chiquita Canyon Sanitary Landfill is only permitted through 2019. While there would be a substantial increase in generated solid waste on the Project Site, adequate landfill capacity appears to be available within the City and nearby landfills. Solid waste generated during construction and operation of the Project would be required to comply with all federal, state, and local statutes and regulations to reduce and recycle solid waste. Therefore, impacts would be less than significant.</p>	<p>Less than Significant</p>	<p>No mitigation necessary.</p>	<p>Less than Significant</p>
Cumulative Impacts			
Wastewater	Less than Significant	No mitigation necessary.	Less than Significant

Project Impacts	Impact without Mitigation	Mitigation Measures	Impact with Mitigation
<p>Completion of proposed Project improvements would convey most of the wastewater flow to the point of connection (POC) along the existing sewer lines north of the site along Telegraph Road. In addition, the WRF has been designed to accept wastewater from the cumulative growth of the City under the General Plan, including all related projects. As such, the Project's contribution to cumulative wastewater system and treatment impacts would be less than significant.</p> <p><u>Water</u></p> <p>The Specific Plan's demand for water use would meet the projected development demands within the City. Additionally, the Project would use less water than the existing agricultural operations. Therefore, the cumulative increase in water demand of related projects and build-out of the City pursuant to the General Plan is considered less than significant.</p> <p><u>Solid Waste</u></p> <p>The City would utilize the Toland Road Landfill until the landfill reaches capacity. At the time Toland Road Landfill closes, the City would utilize the capacity of the five remaining landfills previously used for solid waste disposal. The combined remaining capacity of the five landfills is estimated to last for 95 years, or an average of 19 years.</p>			

Project Impacts	Impact without Mitigation	Mitigation Measures	Impact with Mitigation
<p>As such, cumulative impacts would be less than significant because the six landfills discussed above have sufficient capacity for decades to service the development of the Specific Plan and other development requiring solid waste disposal.</p>			

2.4 SUMMARY OF ALTERNATIVES

The Draft EIR considered a range of alternatives to the Project in accordance with CEQA Guidelines Section 15126.6, which requires that an EIR describe and evaluate a range of reasonable alternatives to a project to promote informed decision making.

The alternatives to the Project evaluated in the Draft EIR include the following:

Alternative 1: No Project Alternative—No Development

Alternative 2: 25 Percent Reduction Alternative

Alternative 3: 50 Percent Reduction Alternative

A brief description of each of these alternatives is provided below, along with a summary of the evaluation of each.

According to the CEQA Guidelines, the discussion of alternatives should focus on alternatives to a project or its location that can feasibly avoid or substantially lessen the significant effects of the proposed project. Section 4.0: Environmental Impact Analysis, of the Draft EIR concludes that Project implementation would result in significant and unavoidable environmental impacts. These include construction and operation impacts to aesthetics; impacts to agricultural resources; construction impacts to air quality; and Project and cumulative impacts to transportation and traffic. In response to these impacts, the City of Santa Paula identified and considered several alternatives to the proposed Project to determine if the alternatives could avoid or substantially lessen these significant impacts.

Alternative 1: No Project Alternative—No Development

The No Project Alternative—No Development is required to be evaluated by Section 15126(2)(4) of the CEQA Guidelines. As required by the CEQA Guidelines, the analysis must examine impacts that might occur if the site were left in its present condition, as well as what may reasonably be expected to occur in the foreseeable future if the Project were not approved based on current plans and consistent with available infrastructure and community services. Under the No Project Alternative—No Development, the Project Site would not be developed with additional uses and would remain in its current state, as agricultural fields.

Alternative 2: 25 Percent Reduction Alternative

This alternative assumes that there would be a 25 percent reduction in the 53.81 acres that make up the proposed Project. This assumes that 75 percent, or approximately 40.36 acres, of the Project would be built within the Specific Plan area; and 25 percent, or approximately 13.45 acres, would remain under the

jurisdiction of the County of Ventura, with land use subject to the County's General Plan and zoning and agricultural operations continuing.

The 25 Percent Reduction Alternative would reduce impacts to agricultural resources, air quality, greenhouse gas, transportation and traffic, wastewater, solid waste, and stormwater when compared to the proposed Project. However, significant and unavoidable impacts would not be avoided or substantially lessened. Land use impacts would be greater because this alternative would be potentially inconsistent with the goals and objectives of the General Plan Land Use Element, specifically, objective 5(f), "Sufficient land should be provided for all uses, including parks, low-density residential, industrial and neighborhood commercial, to accommodate projected population growth to the year 2020."

Alternative 3: 50 Percent Reduction Alternative

Alternative 3 assumes that there would be a 50 percent reduction in the 53.81 acres that make up the proposed Project. This assumes that 50 percent, or approximately 26.90 acres, of the Project would be built with the Specific Plan area; and 50 percent, or approximately 26.90 acres, would remain under the jurisdiction of the County of Ventura, with land use subject to the County's General Plan and zoning, and agricultural operations continuing.

The 50 Percent Reduction Alternative would result in reduced impacts to aesthetics, agricultural resources, air quality, biological resources, greenhouse gases, noise, transportation and traffic, wastewater, solid waste, and stormwater when compared to the proposed Project, and would avoid the significant and unavoidable traffic impact of the proposed Project at one intersection. Land use impacts would be greater because this alternative would be potentially inconsistent with the goals and objectives of the General Plan Land Use Element, specifically, objective 5(f), "Sufficient land should be provided for all uses, including parks, low-density residential, industrial and neighborhood commercial, to accommodate projected population growth to the year 2020."

Environmentally Superior Alternative

The CEQA Guidelines require that an environmentally superior alternative be identified among the selected alternatives.¹ If the No Project Alternative is determined to be the environmentally superior alternative, an environmentally superior alternative must also be identified among the remaining alternatives.

Alternative 1, the No Project Alternative, would have the fewest impacts and would not result in any significant impacts; making it the environmentally superior alternative. However, the No Project

1 California Code of Regulations, tit. 14, sec. 15126.6(e)(2).

Alternative would not meet the objectives of the proposed Project. As noted above, if the No Project Alternative is determined to be environmentally superior, the CEQA Guidelines require that an environmentally superior alternative must also be identified among the remaining alternatives.

The environmentally superior alternative among the remaining alternatives would be Alternative 3, the 50 Percent Reduction Alternative. This alternative would avoid the significant and unavoidable traffic impacts identified at one intersection.

However, this alternative would not eliminate the significant and unavoidable impacts for aesthetics, agricultural resources, and air quality during construction; would not be consistent with applicable land use policies; and would not achieve the basic objectives of the Project as defined by the City of Santa Paula. Additionally, water usage would be greater by approximately 120.6 acre-feet per year (afy) when compared to the build-out of the proposed Project, because of the higher water use for the existing agriculture uses.

3.0 RESPONSES TO COMMENTS

This section provides written responses to all comments received on the Draft Environmental Impact Report (“Draft EIR”) during its public review period from November 4 through December 19, 2016. Some comments were received after the comment period closed. CEQA does not require Lead Agencies to respond to these comments; however, these are included with responses in this section. Comments were received in the form of letters and emails.

The City received 15 written comment letters and emails from state agencies, local agencies, private organizations, and the public, two of which were duplicate letters, making a total of 13 letters. A list of all letters and emails is provided in **Table 3.0-1: Comment Letters**.

Each comment within each comment letter or email has been numbered. Each response is also numbered to correspond to the relevant individual comment. The original letters and emails are provided after the complete set of responses.

Subject: Santa Paula West Business Park Specific Plan
SC#:# 2014081104

Dear Janna Minsk:

The State Clearinghouse submitted the above named Draft EIR to selected state agencies for review. On the enclosed Document Details Report please note that the Clearinghouse has listed the state agencies that reviewed your document. The review period closed on December 19, 2016, and the comments from the responding agency (ies) is (are) enclosed. If this comment package is not in order, please notify the State Clearinghouse immediately. Please refer to the project's ten-digit State Clearinghouse number in future correspondence so that we may respond promptly.

Please note that Section 21104(c) of the California Public Resources Code states that:

"A responsible or other public agency shall only make substantive comments regarding those activities involved in a project which are within an area of expertise of the agency or which are required to be carried out or approved by the agency. Those comments shall be supported by specific documentation."

These comments are forwarded for use in preparing your final environmental document. Should you need more information or clarification of the enclosed comments, we recommend that you contact the commenting agency directly.

This letter acknowledges that you have complied with the State Clearinghouse review requirements for draft environmental documents, pursuant to the California Environmental Quality Act. Please contact the State Clearinghouse at (916) 445-0613 if you have any questions regarding the environmental review process.

Sincerely,

Scott Morgan
Director, State Clearinghouse

SCH# 2014081104
Project Title Santa Paula West Business Park Specific Plan
Lead Agency Santa Paula, City of

Type EIR Draft EIR
Description The specific plan would guide future land use development on approximately 53.81 acres of the city's 125-acre West Area 2 designation. West Area 2 was included as an expansion area in the city's general plan, which was approved by the city of Santa Paula in 1998. This designation allows for a variety of manufacturing, research and development, professional office, and limited commercial uses, with integrated vehicular circulation, pedestrian walkways, and infrastructure. The land uses envisioned within the specific plan would be a mix of low-intensity industrial (such as light manufacturing or research and development), professional offices, and supporting commercial businesses. These uses are allowed in the commercial/light industrial and light industrial zones.

Mr. Stratis Perros
Deputy Planning Director
City of Santa Paula
P.O. Box 569
Santa Paula, CA 94061-0569
sperros@spcity.org

Subject: Comments on the Draft Environmental Impact Report for the Santa Paula West Business Park Specific Plan, Ventura County, SCH#2014081104

Dear Mr. Perros:

The California Department of Fish and Wildlife (CDFW) received a Draft Environmental Impact Report from the City of Santa Paula for the West Business Park Specific Plan Project pursuant to the California Environmental Quality Act (CEQA) and CEQA Guidelines.¹ CDFW previously submitted comments in response to the Notice of Preparation on September 26, 2014 to the City of Santa Paula (City).

Thank you for the opportunity to provide comments and recommendations regarding those activities involved in the Project that may affect California fish and wildlife. Likewise, we appreciate the opportunity to provide comments regarding those aspects of the Project that CDFW, by law, may be required to carry out or approve through the exercise of its own regulatory authority under the Fish and Game Code.

CDFW ROLE

CDFW is California's **Trustee Agency** for fish and wildlife resources, and holds those resources in trust by statute for all the people of the State. (Fish & G. Code, §§ 711.7, subd. (a) & 1802, Pub. Resources Code, § 21070; CEQA Guidelines § 15386, subd. (a).) CDFW, in its trustee capacity, has jurisdiction over the conservation, protection, and management of fish, wildlife, native plants, and habitat necessary for biologically sustainable populations of those species. (*Id.*, § 1802.) Similarly for purposes of CEQA, CDFW is charged by law to provide, as available, biological expertise during public agency environmental review efforts, focusing specifically on projects and related activities that have the potential to adversely affect fish and wildlife resources.

CDFW is also submitting comments as a **Responsible Agency** under CEQA. (Pub. Resources Code, § 21069; CEQA Guidelines, § 15381.) CDFW expects that it may need to exercise regulatory authority as provided by the Fish and Game Code. As proposed, for example, the Project may be subject to CDFW's lake and streambed alteration regulatory authority. (Fish & G. Code, § 1600 et seq.) Likewise, to the extent implementation of the Project as proposed

2-1

¹ CEQA is codified in the California Public Resources Code in section 21000 et seq. The "CEQA Guidelines" are found in Title 14 of the California Code of Regulations, commencing with section 15000.

Conserving California's Wildlife Since 1870

Mr. Stratis Perros
Deputy Planning Director
City of Santa Paula

may result in "take" as defined by State law of any species protected under the California Endangered Species Act (CESA) (Fish & G. Code, § 2050 et seq.), related authorization as provided by the Fish and Game Code will be required.

2-1

PROJECT DESCRIPTION SUMMARY

The proposed Specific Plan contains a comprehensive set of plans, exhibits, regulations, conditions, and programs for orderly development of the Santa Paula West Business Park, which is designed to contain a combination of professional office, manufacturing, research and development, and limited commercial uses on approximately 54 acres located along the western edge of the City of Santa Paula. In addition to regulating land use, the Specific Plan addresses vehicular circulation, landscaping, pedestrian walkways, and infrastructure. The proposed Specific Plan area is bounded to the north by Telegraph Road, to the east by existing industrial and commercial development within the existing Santa Paula City limits, to the south by agriculture, and to the west by Adams Barranca. The Adams Barranca, located along the western boundary of the business park, would be zoned Open Space/Passive. The Specific Plan area also contains frontage along State Route 126 and Telegraph Road, and is bisected by the Ventura County Transportation Commission railroad right-of-way.

2-2

COMMENTS AND RECOMMENDATIONS

CDFW offers the comments and recommendations below to assist the City in adequately identifying and/or mitigating the Project's significant, or potentially significant, direct and indirect impacts on fish and wildlife (biological) resources. Editorial comments or other suggestions may also be included to improve the document.

Biological Mitigation Measures: The DEIR provides thorough evaluation of potential biological impacts and has developed biological mitigation measures BR-1 through BR-10 to reduce potential impacts. The following comments are made to help further clarify and specify actions within the measures.

1. Biological mitigation measures BR-3 and BR-4 are thoroughly developed to reduce potential impacts to native nesting birds. However, least Bell's vireo and southwestern willow flycatcher, both State and federally-listed species have the potential to occur in suitable habitat in Adams Barranca. CDFW recommends a biological mitigation measure be developed that requires protocol level surveys for least Bell's vireo (*Vireo bellii pusillus*) and southwestern willow flycatcher (*Empidonax trailii extimus*) within the suitable habitat along the Adams Barranca.

Survey protocol for least Bell's vireo can be found at:

<https://www.fws.gov/pacific/ecoservices/endangered/recovery/documents/LBVireo.2001.protocol.pdf>.

Survey protocol for southwestern willow flycatcher can be found at:

<https://www.fws.gov/pacific/ecoservices/endangered/recovery/documents/SWWFlycatcher.2000.protocol.pdf>.

2-3

Mr. Stratis Perros
Deputy Planning Director
City of Santa Paula
December 16, 2016
Page 3 of 3

2. Biological mitigation measure BR-10 specifies CDFW streambed jurisdiction mitigation ratios and options. CDFW concurs with the DEIR that a Lake and Streambed Alteration Agreement (LSA) Notification should be submitted to CDFW for the project. However, although the options outlined in BR-10 look feasible, CDFW recommends mitigation ratios and options for impacts be negotiated during the LSA process after a CDFW Environmental Scientist has reviewed the Project on site.

2-4

Minimum Setback Distance: The DEIR discusses the proposed Project along the open space zoning but does not clearly specify a recommended buffer area setback. CDFW submitted comments on the Notice of Preparation on September 26, 2014. As stated in the letter, CDFW concurs with the Open Space zoning and would like to again recommend a minimum setback of 100-150 feet between the edge of riparian habitat within the Adams Barranca and the Open Space adjacent to the barranca to facilitate stream habitat function and wildlife use.

2-5

Thank you again for the opportunity to comment on the referenced DEIR and for the City's thorough evaluation of potential biological impacts based on CDFW's NOP comment letter, and on other comment letters provided at the NOP stage. Questions regarding this letter and further coordination on these issues should be directed to Dan Blankenship, Senior Environmental Scientist (Specialist), at (661) 259-3750 or Daniel.Blankenship@wildlife.ca.gov.

Sincerely,

for
Betty J. Courtney
Environmental Program Manager I

ec: Christine Found-Jackson, CDFW, Westlake Village
Brock Warmuth, CDFW, Ventura
Scott Morgan (State Clearinghouse)

Letter No. 2

Betty J. Courtney, Environmental Program Manager I
California Department of Fish and Wildlife (CDFW)
Letter dated December 16, 2016

It should be noted that this letter was submitted directly to both the City and the State Clearinghouse. The letters are identical; to avoid confusion, only one copy of the letter has been included in this document.

Response 2-1:

This comment does not address the information or analysis in the Draft EIR. No further response is required.

Response 2-2:

This comment does not address the information or analysis in the Draft EIR. No further response is required.

Response 2-3:

In response to the potential for least Bell's vireo and southwest willow flycatcher to exist on or near the Project Site, a requirement to conduct protocol surveys for these species prior to construction has been added to mitigation measure **BR-3**. The Draft EIR has been revised accordingly and edits can be found in **Section 4: Revisions to the Draft EIR**.

Response 2-4:

The Project will comply with the requirements of CDFW and the Lake and Streambed Alteration (LSA) Program. Should the ratios and options identified in the EIR be revised as part of the process, they will be documented in the Streambed Alteration Agreement (SAA) that will result.

Response 2-5:

The proposed Specific Plan requires that all development be set back 100 feet from the upland edge of the riparian habitat in the Adams Barranca. As shown in **Figure 3.0-1: Proposed Riparian Habitat Buffer for Adams Barranca**, the buffer will be located along the southern portion of the Project Site and Assessor Parcel Numbers (APNs) 098-0-010-150 and 098-0-010-190. The buffer will not include the area adjacent to parcel APN 098-0-010-420 to the south because that parcel is developed and is located between the Project Site and the Adams Barranca.

The buffer area will be limited in use, and construction of the buildings outside the buffer and landscaping activities inside the buffer are required to be conducted to not degrade lakes, ponds, wetlands, or perennial watercourses in the Adams Barranca through filling, sedimentation, erosion, increased turbidity, or other contamination. Additionally, within the buffer area, permitted uses will include the following: passive recreation; educational uses; utility lines; pipelines; drainage and flood control of facilities; bridges and road approaches to bridges to cross a stream; and approved roads.

All permitted development in or adjacent to streams, wetlands, and other aquatic habitats must be designed and/or conditioned to prevent loss or disruption of the habitat, protect water quality, and maintain or enhance (when feasible) biological productivity. Design measures to be provided include but are not limited to:

- i. Flood control and other necessary instream work shall be implemented in a manner than minimizes disturbance of natural drainage courses and vegetation.
- ii. Drainage control methods shall be incorporated into projects in a manner that prevents erosion, sedimentation, and the discharge of harmful substances into aquatic habitats during and after construction.

Dear Janna Minsk:

The enclosed comment (s) on your Draft EIR was (were) received by the State Clearinghouse after the end of the state review period, which closed on December 19, 2016. We are forwarding these comments to you because they provide information or raise issues that should be addressed in your final environmental document.

The California Environmental Quality Act does not require Lead Agencies to respond to late comments. However, we encourage you to incorporate these additional comments into your final environmental document and to consider them prior to taking final action on the proposed project.

Please contact the State Clearinghouse at (916) 445-0613 if you have any questions concerning the environmental review process. If you have a question regarding the above-named project, please refer to the ten-digit State Clearinghouse number (2014081104) when contacting this office.

Sincerely,

Scott Morgan
Director, State Clearinghouse

12/14/16 E

RE: Santa Paula West Business Park
Specific Plan
Vic. VN-126/ PM R9.72
GTS#07-VEN-2016-00019ME-DEIR

Dear Ms. Minsk:

Thank you for including the California Department of Transportation (Caltrans) in the environmental review process for the above referenced plan. The Specific Plan would guide future land use development on approximately 53.81 acres of the City's 125-acre West Area 2 designation. This designation allows for a variety of manufacturing, research and development, professional office, and limited commercial uses, with integrated vehicular circulation, pedestrian walkways, and infrastructure. The Specific Plan also serves to facilitate development within the Project Site as a master-planned business park that includes a variety of light industrial and commercial uses.

The nearest State facility to the proposed project is State Route-126. As stated in the Draft Environmental Impact Report, the traffic analysis indicated that the proposed project would cause or contribute to significant traffic impacts at the following intersections. Included below are also proposed mitigations at each location:

- **Peck Road & SR 126 EB on/off ramps/Acacia Way-**
This intersection could be mitigated to LOS C or better by installing a traffic signal.
- **Faulkner Road & SR 126 Westbound on/off ramps-**
This intersection could be mitigated to LOS C or better by reconfiguring the westbound approach. The westbound approach can be restriped to provide one share through/right-turn lane and two left-turn lanes. While the freeway on-ramp at this location currently provided two lanes, this improvement would require coordination with and approval by Caltrans

4-1

4-2

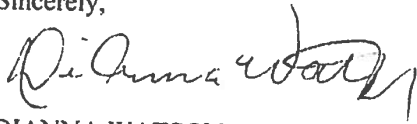

It is noted that because these are cumulative impacts, the Project applicant would only be responsible for their fair share contributions for these mitigation improvements. Caltrans is in agreement with the proposed mitigation and have no additional comments.

*"Provide a safe, sustainable, integrated and efficient transportation system
to enhance California's economy and livability"*

Ms. Minsk
December 20, 2016
Page 2

In the spirit of mutual cooperation, Caltrans staff is available to work with your planners and traffic engineers for this project, if needed. If you have any questions regarding these comments, please contact project coordinator Ms. Miya Edmonson, at (213) 897-6536 and refer to GTS# VEN-2016-00019ME.

Sincerely,

DIANNA WATSON
IGR/CEQA Branch Chief

cc: Scott Morgan, State Clearinghouse

*"Provide a safe, sustainable, integrated and efficient transportation system
to enhance California's economy and livability"*

Letter No. 4

Dianna Watson, Branch Chief
California Department of Transportation (Caltrans)
Letter dated December 19, 2016

It should be noted that this letter was submitted directly to the City, as well as to the State Clearinghouse (see Letter No. 3). The letters are identical; to avoid confusion, only one copy of the letter has been included in this document.

Given the time since the original traffic study was conducted, the City of Santa Paula requested that a traffic baseline and growth forecast validation be conducted. This information is contained with **Appendix F: Baseline Traffic and Growth Validation** of this Final EIR. Based on this data and analysis, it was determined that the conclusions of the original traffic impact study remain valid and that no new significant impacts would occur that are not already identified in the original study.

Response 4-1:

The Draft EIR addresses mitigation for this intersection (Intersection 10) that is consistent with this recommendation, as shown in mitigation measure **TRA-2** in Section 4.13: Transportation and Traffic. As shown, this mitigation measure requires the installation of a traffic signal.

Response 4-2:

As shown in the Section 4.13: Transportation and Traffic of the Draft EIR, this mitigation measure requires the reconfiguration of the westbound approach by restriping to provide one shared through/right-turn lane and two left-turn lanes. While the freeway on-ramp at this location currently provides two lanes, this improvement would require coordination with and approval by Caltrans.

Adams Barranca, Santa Clara River Watershed, Zone 2
Watershed Protection District Project No. WC2016-0108

Pursuant to your request, this office has reviewed the Draft Environmental Impact Report for Santa Paula West Business Park Specific and offers the following comments.

PROJECT LOCATION:

The Project Site is a 53.81-acre area near the western boundary of the City of Santa Paula and currently lies within the unincorporated County of Ventura. The Project Site is bound to the north by Telegraph Road, to the south by SR 126, to the east by existing industrial and commercial developments in the existing City limits, and to the west by the Adams Barranca and agricultural operations. The Project Site is bisected by the Ventura County Transportation Commission (VCTC) railroad right-of-way.

PROJECT DESCRIPTION:

The Santa Paula West Business Park Specific Plan encompasses approximately 58 acres of land in unincorporated Ventura County west of the City of Santa Paula. The proposed Specific Plan would permit the development of a variety of manufacturing, research and development, professional office, and limited commercial uses.

WATERSHED PROTECTION DISTRICT COMMENTS:

December 6, 2016
RMA 14-019-1 – Santa Paula West Business Park
Specific Plan Draft EIR
Page 2 of 6

A. General Comments

1. Adams Barranca is a District jurisdictional redline channel that borders the west side of the project site. At the project site, the barranca has a catch basin area of 5,580 acres (8.7 square miles) and a 100-year peak discharge of 6,880 cubic feet per second (cfs) according to the official Santa Clara River Feasibility Study HSPF hydrologic study report. The barranca is mostly a natural earthen channel with occasional farm berms. Based on the Preliminary Drainage Report prepared for this project, all road crossing structures have inadequate capacities to pass the 100-year discharge, with the double culvert under Highway 126 having a capacity of 2,200 cfs. In the existing conditions, stormwater may break out of the barranca at the upstream and downstream of Telegraph Road and flood the agricultural lands on both side of the barranca. Some of the break-out stormwater may flow through the project site and join Todd Lane Drain before joining the Santa Clara River. 6-1
2. This project proposes to fill the project site and raise the ground elevation up to 6 feet to bring the site out of the 100-year floodplain. Please analyze the regional hydrologic impacts of the project due to loss of the natural storage and blockage of the flow path to Todd Lane Drain. Please evaluate mitigation measures if the impacts are found to be significant. 6-2
3. The hydraulic analysis indicates that around 2,637 cfs stormwater would break out of the barranca upstream of the Telegraph Road, overtop the road and join the proposed parallel channel on the project site under post-development conditions. Please explain how the breakout water would be collected and directed to the excavated channel. 6-3
4. Initial investigation shows that stormwater may breakout further upstream (upstream of Santa Paula Street) during a 100-year storm event and potentially impact the project site. Please extend the hydraulic model further upstream to fully evaluate the onsite flood risks for both the existing and proposed conditions. 6-4
5. Due to the close proximity of the proposed parallel channel with the barranca, please analyze the stability of the east bank of the barranca under the proposed conditions. 6-5
6. Please discuss the sediment management strategy for the proposed project. 6-6

December 6, 2016
RMA 14-019-1 – Santa Paula West Business Park
Specific Plan Draft EIR
Page 3 of 6

7. The Draft EIR does not discuss the potential impacts to the project from the District debris basin located upstream of Foothill Road. This basin traps the medium to coarse sediment generated in the upper watershed by smaller storms, but has the potential to fill with sediment and/or floodwaters in larger storms. Any potential impacts to the project should be discussed in the Final EIR and addressed during the final design phase of the project.
8. The drainage report and plans to be provided during the final design phase of the project will be reviewed to confirm that they have achieved the level of mitigation presented in the Draft EIR and that they meet the design criteria of the Ventura County Watershed Protection District and the City of Santa Paula.

B. Detailed Comments

On Santa Paula West Business Park Specific Plan EIR Report

9. On page 2.0-27, "*Grading over the Project Site includes an estimated 80,000 cubic yards of cut and 179,000 cubic yards of fill, requiring the import of approximately 99 cubic yards of soil*". Please replace "99 cubic yards" with "99,000 cubic yards" for the statement to read correctly.
10. On page 2.0-27, "*One acre of land within the Specific Plan boundary has been set aside for detention basins totaling approximately 6 acre-feet of volume*". If the volume of cut is 80,000 cubic yards (50 acre-feet) and the detention basins volume is 6 acre-feet, please explain where the remaining 44 acre-feet of cut is coming from.
11. On page 2.0-27, "*The basin along Adams Barranca will include debris catchment facilities to reduce debris from storm flows that have caused problems at the railroad culvert and the Caltrans culvert in this channel*". Please determine debris yield of Adams Barranca at the project site, design and discuss debris catchment facilities, and develop an operation and maintenance plan for the facilities.
12. On page 2.0-27, "*These detention basins will serve dual roles of flood protection and water quality enhancement*". On page 4.9-19, "*The detention basins will be sized to treat 10 percent of the 50-year storm event from the storm drain, consistent with the Ventura County SQUIMP guidelines*". "*The Peak flows would*

Specific Plan Draft EIR
Page 4 of 6

not exceed existing conditions, so there would not be adverse effects downstream". In addition, these basins (or some of them) are designed to catch debris (see comment #9 above). Please analyze and explain how all these functions for the basins are achieved simultaneously.

6-12

13. On page 2.0-28, "*The new channel would join with the existing Adams Barranca at the railroad crossing and the SR 126 crossing*". The report indicates the split flows would not be able to re-join the barranca at the railroad crossing or at the SR 126 culvert under the existing conditions. No plans are included to show how the new channel would join the existing Adams Barranca at these locations. There is no impact analysis resulting from these modifications to the existing Adams Barranca. Please analyze and illustrate the proposed juncture with Adams Barranca.

6-13

On EIR Appendix 4.9: Adams Barranca Existing Condition Hydrology Study and Preliminary Hydrology Report for Santa Paula West Business Park

14. There are three sets of hydrology/drainage study reports included in this appendix: 1) Adams Barranca Existing Condition Hydrology Study, dated December 2011; 2) Santa Paula West Business Park Preliminary Drainage Report, dated February 2011; and 3) Santa Paula West Business Park Preliminary Drainage Report, dated November 2015. Some of the information contained in the previous reports is either obsolete or outdated. For example, the project boundary in the exhibit in Appendix A of the first report is obsolete, and the basin layouts on exhibits in the second report are outdated. To facilitate future reviews and for better documentation, please consolidate the analyses into one updated report. The District's review has been focused on the latest drainage report dated November 2015.

6-14

15. For regional hydrology, please use the Santa Clara River Feasibility Study HSPF results since it has been reviewed and approved by FEMA, USACE, and the District. This will facilitate future CLOMR/LOMR applications. It is acceptable to use the VCRAT program to evaluate onsite hydrology and project impacts. The VCRAT program incorporates more detailed subareas and routing reaches.

6-15

16. There is no discussion or explanation of how the proposed basins would function simultaneously as detention basins, water quality basins, and debris basins. There are no calculations to support the numbers in Table 2B – Santa Paula West Business Park Specific Plan Proposed Runoffs with Detention. Although

6-16

December 6, 2016
RMA 14-019-1 – Santa Paula West Business Park
Specific Plan Draft EIR
Page 5 of 6

there are Pond Reports for detention basins in the second report, that report is outdated due to a change of basin layouts.

6-16

17. There appear to be critical errors in the existing conditions HEC-RAS model setup. One example is that the channel flow conveyance is utilized three times by the three different plans: the main channel plan - Ex_AdamsBarranca, the east overbank flow plan - Ex_EastOverbank_Adams, and the west overbank flow plan - Ex_WestOverbank_Adams (see figures below).

6-17

18. For the proposed condition HEC-RAS model, please show the complete proposed channel geometry (fill).

6-18

Thank you for the opportunity to review the Draft EIR for this project.

END OF TEXT

Letter No. 6

E. Zia Hosseinipour, Manager
Ventura County Watershed Protection District
Advanced Planning Section
Letter dated December 6, 2016

Response 6-1:

At the Project Site, Adams Barranca has catch basins areas of 5,580 acres and a 100-year peak discharge of 6,880 cubic feet per second (cfs), according to the Santa Clara River Feasibility Study Hydrologic Simulation Program–FORTRAN (HSPF) hydrological study report. Based on the *Santa Paula West Business Park Preliminary Drainage Report*, the roads crossing the structures have inadequate capacities to pass the 100-year discharge with the double culvert under Highway 126, which has a capacity of 2,200 cfs. As noted in the existing conditions discussion (Section 4.9.1 of the Draft EIR), stormwater may break out of the barranca at the upstream and downstream Telegraph Road and flood agricultural fields on both sides of the barranca.

As noted in Table 4.9-3: Existing Condition Flow Summary, in Section 4.9: Hydrology and Water Quality, of the Draft EIR, a small portion of the Santa Paula West Business Park Project Site drains west into Adams Barranca, and Adams Creek runs along the western edge of the proposed Project area. Adams Barranca is a raised channel; on average, the top of the channel is 2 feet higher than the adjacent grade on the Project Site. This portion of the property is subject to flooding during a 100-year storm event from Adams Barranca.

The SR 126 westerly culverts (Area B) currently accepts the flow from approximately 27 acres. Overflow from pipe inlet blockage travels easterly to two other culverts under SR 126 or further east to the inlet at the end of Faulkner Road into a 72-inch reinforced concrete pipe (RCP) leading to the Todd Lane drain. The SR 126 easterly culverts (Areas C and D) currently accept flows from approximately 31 acres. Overflow from pipe inlet blockage travels easterly to the inlet at the end of Faulkner Road into a 72-inch RCP leading to the Todd Lane drain.

As shown in Figure 4.9-2: Current FEMA Flood Insurance Map, in the Draft EIR, the western portion of the site is designated as Flood Zone A, an inaccurate determination of current existing conditions, resulting from Adams Creek overtopping its banks during a 100-year storm event. This flooding is caused by lack of capacity within the channel, lack of capacity at the SR 126 undercrossing, and debris issues at the railroad bridge.

Flood control structures in the vicinity are undersized. The proposed Project provides flood protection for the Project Site and removes proposed development areas from the flood plain without causing adverse effects on existing structures or properties.

As part of the Project, flood control structures would be redesigned and constructed to address the deficiencies by identifying a conservative breakout condition and incorporating into the Project design a safe route for potential overflow around or through the Project Site. As shown in Figure 4.9-3: Conceptual Grading & Drainage Plan, in the Draft EIR, storm drain facilities would be sized to meet City of Santa Paula standards and would accommodate the increased runoff generated by the increase in impervious surfaces. The storm drain system would collect on-site runoff and direct most of it to three separate detention basins prior to outletting into storm drains that connect to the existing culverts under SR 126. The existing SR 126 culverts are exposed, but once the site is elevated by fill, the pipes would be underground and integrated into the new storm drain system. Peak flows would not exceed existing conditions; thus, there would not be adverse effects downstream. Therefore, potential impacts are considered less than significant.

The Project will not increase the flood risk or contribute additional flows to the undersized facilities mentioned in the comment.

Response 6-2:

The proposed Project will replace or match existing storage such that the regional hydrological impacts of the loss of natural storage caused by fill placed on the Project Site would not affect other properties in the area beyond allowed limits. As proposed, the Project will not block the flow path to Todd Lane drain on the east edge of the site because flow areas to the drain would be replaced by new storm drain systems with normal design capacities and include overflow paths. The Project will accept and pass flows that might reach the upstream edge (breakout upstream) from Adams Barranca from existing conditions that affect the Project Site.

The Project will be designed to ensure that any fill within the existing flood is replaced with a comparable amount of storage for flood waters within the flood plain area remaining on the Project Site. The filling of the flood plain within the site will not, therefore, significantly affect off-site flood limits.

Response 6-3:

The development plan proposes an interceptor ditch along the south edge of Telegraph Road to collect water reaching the Project Site from any upstream breakout condition affecting this edge. Under current conditions, this potential overflow would occur as a wide surface flow that would crest over the centerline of Telegraph Road at the road's low points. As noted in the Draft EIR, the expected magnitude of flow

path of this water has been identified, and the ditch will collect the potential overflow water and divert it around edge of the Project Site.

Response 6-4:

The City disagrees that additional analysis is required. The flooding analysis for Adams Barranca extends for nearly 6,500 feet, 2,500 feet below the site extending to the Santa Clara River and 1,500 feet above the site. To establish these limits, the regional flow patterns were reviewed in relation to the proposed Project Site. The model provides a conservative assessment beginning with all potential flows in Adams Barranca. Predominant overland flow above Telegraph Road, as well as more pronounced flow above Santa Paula Street, is to the west toward Clow Road (Haines Barranca) or to the east and the existing City systems that drain to the Todd Lane drain.

Flow patterns above the area included in the model will be affected by Santa Paula Street, which is about 1,000 feet above the model limits and 2,500 feet above the Telegraph Road edge of the site. Santa Paula Street will likely direct any breakout that could affect the Project Site back to the Adams Barranca. Examination of the land above Santa Paula Street did not identify any indication of potential breakout and flow pattern that would change the model result to a more significant flood concern from the Adams Barranca watershed caused by the Project Site.

The model's conservative results used for the evaluation are likely the worst-case condition. The land above the area included in the model on the east side is higher than the west side; if water were to breakout to the west side of the Adams Barranca above Santa Paula Street, it would not return to Adams Barranca. Breakout to the east is unlikely because this side is higher. If this were to occur, it could potentially affect the Todd Lane drain. In considering these factors, the analysis boundary establishes a conservative model for the environmental review of the Project.

Response 6-5:

As proposed and described in the Draft EIR, the west side of the site at the flood protection edge (east edge of the Adams Barranca watershed) will safely convey the flow, considering velocity and scour potential. This edge protection may use rock, concrete, or other suitable material needed to meet flow velocity and scour potential. Final design of the improvement will be illustrated and presented to the City and, as necessary, to the Watershed Protection District, to show stable conditions prior to construction permitting.

Response 6-6:

Current sediment management for Adams Barranca will not be significantly affected by the Project. The Project will include on-site management of on-site sediment for both construction and permanent development through best management practices, vegetation, and low-impact development standards. The capacity of the bypass channel for Adams Barranca overflows will be designed to pass sediment flows and be maintained to remove sediment and debris that may be deposited.

Response 6-7:

The Adams Canyon debris basin is a publicly funded and maintained debris basin located approximately 6,500 feet upstream from the proposed Project and has a storage capacity of more than 84,000 cubic yards. The large ponding area and outlet structure control will provide storm flow attenuation during storm events; with proper maintenance, this basin will reduce the sediment that occurs in Adam Barranca. The debris basin will not affect the proposed Project, and no additional analysis is needed for this reason.

Response 6-8:

The comment is noted. Final design plans will be submitted to the District as requested.

Response 6-9:

The Final EIR has been revised to correct this typographic error, and the edit has been made to page 2.0-27.

Response 6-10:

Detention basin area (volume) and amount of Import are separate and unrelated quantities. Any earthen material required to raise grade above flood plain elevations, not available from on-site excavations, will be imported.

Response 6-11:

The capacity of the bypass channel for Adams Barranca overflows will be designed to pass sediment flows and be maintained to remove sediment and debris that may be deposited. The detailed design of this overflow path will address the debris expected to occur within this watershed. The required size of the facilities will be determined in the detailed final design.

Response 6-12:

On-site detention basins will be designed to mitigate on-site development impacts to the extent required by the MS-4 permit and as normal site development considerations. The detention basins will include storage to reduce post development flow to less than existing peak flows. The on-site basins will provide

infiltration volumes and/or on-site storage to capture the first flush per the MS-4 permit. Please see the *Santa Paula West Business Park Preliminary Drainage Report* (page 8), dated November 2015, for a complete description of the water treatment prior to discharge into the detention basins.

Response 6-13:

The onsite conveyance at the lower southwest corner of the site would combine with flow in Adams Barranca by removing and reconstructing much of the lower +/-250 feet of the east bank of the Barranca. This will allow the overflow to rejoin with the Adams Barranca flow as it reaches the existing SR 126 culvert. Additional ponding will be accommodated within the Project Site channel, and the lower corner of the site will be designed to replace flood plain storage from what currently exists. The storage on the Caltrans culvert is potentially undersized, so the comingled flows would be designed to pond to a depth equal to or near present condition before finding overland relief across the SR 126.

Response 6-14:

The applicable reports are the *Adams Barranca Existing Condition Hydrology Study* dated December 2011 and the *Santa Paula West Business Park Preliminary Drainage Report*. It appears the District has reviewed the appropriate reports.

Response 6-15:

The regional hydrology information from the reports identified in this comment was used in the hydrology study for the Project.

Response 6-16:

See **Response to Comment 6-12**.

The on-site stormwater quality and on-site basin final design will be reviewed by the City of Santa Paula.

Response 6-17:

The existing condition HEC-RAS model setup has a levee in place on the east overbank plan so that the flow conveyance of the channel is not included in the cross-sectional area for flow. The west overbank area has ineffective flow area where the main channel is located and, therefore, is not accounted for in the water surface elevations of the cross sections. The final Conditional Letter of Map Revision (CLOMR) application will show the existing and proposed conditions per Federal Emergency Management Agency (FEMA) requirements.

The model runs have been reviewed, and there are no errors.

Response 6-18:

The cross sections for the proposed condition in the HEC-RAS model shows the parallel channel and the proposed preliminary design. As the site moves forward in design, the HEC-RAS model will be updated accordingly and will meet the FEMA requirements for a CLOMR.

Memorandum

County of Ventura • Resource Management Agency • Planning Division
800 S. Victoria Avenue, Ventura, CA 93009-1740 • (805) 654-2478 • ventura.org/rma/planning

DATE: December 15, 2016

TO: Janna Minsk, AICP, Planning Director

FROM: Whitney Wilkinson, Ventura County Planning Division

SUBJECT: Notice of Availability of a Draft Environmental Impact Report for the Santa Paula West Business Park Specific Plan (RMA 14-019-1)

The Ventura County Planning Division has reviewed the Draft Environmental Impact Report (DEIR) for the Santa Paula West Business Park Specific Plan, and have the following comments that the City of Santa Paula should consider with regard to the analysis of impacts to biological resources.

1. Wetlands and Waters

The DEIR provides for an area adjacent to Adams Barranca to serve as passive open space. However, the DEIR does not provide the buffer distance of this passive open space between the Adams Barranca and the boundary of proposed disturbance and/or development.

Adams Barranca is a Ventura County Red Line Channel that flows into the Santa Clara River. According to the DEIR, it supports “a mixed southern willow riparian woodland vegetation community with trees and shrubs within the banks and along the channel within the ordinary high water mark.” In addition, it has the potential to support special status wildlife species. Biological Resource Policy 1.5.2-4 in the Ventura County General Plan Goals Policies is as follows:

Discretionary development shall be sited a minimum of 100 feet from significant wetland habitats to mitigate the potential impacts on said habitats. Buffer areas may be increased or decreased upon evaluation and recommendation by a qualified biologist and approval by the decision-making body. Factors to be used in determining adjustment of the 100 foot buffer include soil type, slope stability, drainage patterns, presence or absence of endangered, threatened or rare plants or animals, and compatibility of the proposed development with the wildlife use of the wetland habitat area. The requirement of a buffer (setback) shall not preclude the use of replacement as a mitigation when there is no other feasible alternative to allowing a permitted use, and if the replacement results in no net loss of wetland habitat. Such replacement shall be "in kind" (i.e. same type and acreage), and provide wetland habitat of comparable biological value. On-site replacement shall

7-1

be preferred wherever possible. The replacement plan shall be developed in consultation with California Department of Fish and Game.

7-1

Based on the information in the DEIR, it would appear this drainage functions as a Significant Wetland Habitat. It is recommended the buffer distance between Adams Barranca and proposed development be at least 100 feet in order to establish consistency with this policy. In addition, clarification is needed as to what is proposed for this buffer area and what is meant by “passive open space”.

2. Federally Listed Species

The DEIR states that there is marginal habitat for southwestern willow flycatcher (*Empidonax trailii extimus*) (FE, SE) and least Bell’s vireo (*Vireo bellii pusillus*) (FE, SE). Disturbance to these nesting listed species could result in violation of the Migratory Bird Treaty Act, Department of Fish and Game Code, and Endangered Species Act. The pre-construction surveys for nesting birds described in Mitigation Measure BR-3 require weekly surveys, with the last survey conducted no more than 3 days prior to initiation of construction work. However, a survey immediately before land clearing and construction activity is recommended to mitigate any potentially significant impacts to least Bell’s vireo because this species tends to move around frequently during nesting and may be missed within a 3 day period. It is also recommended you contact the US Fish and Wildlife Service to determine how best to address these potential impacts in the Final EIR.

7-2

Thank you for the opportunity to comment on the DEIR. If you have questions regarding this submittal, please contact Whitney Wilkinson at 805-654-2462 or whitney.wilkinson@ventura.org.

Letter No. 7

Whitney Wilkinson
County of Ventura Resource Management Agency
Planning Division
Memorandum dated December 15, 2016

Response 7-1:

The proposed Specific Plan will require that all new development be set back 100 feet from the upland edge of the riparian habitat in the Adams Barranca. As shown in **Figure 3.0-1: Proposed Riparian Habitat Buffer for Adams Barranca**, the buffer will be located along the southern portion of the Project Site and APNs 098-0-010-150 and 098-0-010-190. The buffer will not include the area adjacent to parcel APN 098-0-010-420 to the south because that parcel is developed and is located between the Project Site and the Adams Barranca.

The buffer area will be limited in use, and construction of the buildings outside the buffer and landscaping activities inside the buffer shall be conducted to not degrade lakes, ponds, wetlands, or perennial watercourses in the Adams Barranca through filling, sedimentation, erosion, increased turbidity, or other contamination. Additionally, within the buffer area, permitted uses will include the following: passive recreation; educational uses; utility lines; pipelines; drainage and flood control facilities; bridges and road approaches to bridges to cross a stream; and approved roads.

All permitted development in or adjacent to streams, wetlands, and other aquatic habitats shall be designed and/or conditioned to prevent loss or disruption of the habitat, protect water quality, and maintain or enhance (when feasible) biological productivity. Design measures to be provided include but are not limited to:

- i. Flood control and other necessary instream work shall be implemented in a manner than minimizes disturbance of natural drainage courses and vegetation.
- ii. Drainage control methods shall be incorporated into projects in a manner that prevents erosion, sedimentation, and the discharge of harmful substances into aquatic habitats during and after construction.

Response 7-2:

Because of the potential for least Bell's vireo and southwestern willow flycatcher to occupy habitat along Adams Barranca, a requirement to conduct protocol surveys for these species prior to construction has been added to mitigation measure **BR-3**. The Final EIR (see page 4.4-44) has been revised accordingly.

Given that the protocol surveys for the southwest flycatcher require a certified biologist to make at least three visits during the third (or last) survey period (June 22 to July 17) because nesting southwestern willow flycatchers can be more difficult to detect once breeding efforts are well underway, and also given that the protocol surveys for least Bell's vireo will take place at least eight (8) times during the period from April 10 to July 31, there is no need for additional surveys within a 3-day period before the start of construction.¹

VENTURA COUNTY
AIR POLLUTION CONTROL DISTRICT
Memorandum

TO: Janna Minsk, Planning Director, City of Santa Paula

DATE: December 6, 2016

FROM: Alicia Stratton

SUBJECT: Request for Review of Draft Environmental Impact Report for the Santa Paula West Business Park Specific Plan, City of Santa Paula (Reference No. 14-019-1)

Air Pollution Control District staff has reviewed the draft environmental impact report (DEIR), which is a proposal for a specific plan containing a comprehensive set of plans, exhibits, regulations, conditions and programs for orderly development of the Business Park. The Business Park would contain a combination of office, manufacturing, research and development, professional office, and limited commercial uses on approximately 54 acres of the City's 125-acre West Area 2 designation and would be developed over a ten-year period. The project location is unincorporated land west of the City of Santa Paula, south of Telegraph Road, and east of the Adams Barranca.

Section 4.3 of the DEIR addresses air quality issues. We concur with the findings of this discussion that significant operational, long-term and construction related, short-term air quality impacts would result from the project. Table 4.3-8, Page 4.3-21, *Operational Emissions*, indicates that 29.71 lbs/day reactive organic gases and 22.93 lbs/day oxides of nitrogen would be generated by the project. APCD has a 25 lbs/day threshold for reactive organic compounds and oxides of nitrogen as described in the Ventura County Air Quality Assessment Guidelines. Therefore reactive organic gases from the project would exceed the threshold and would need to be mitigated to a level less than significant. This is addressed below. Short-term, construction related emissions are presented in Table 4.3-6, *Construction Emissions* (Page 4.3-19) and in Table 3.4-7, Page 4.3-20, *Worst-Case Construction Emissions* (2020). These table indicates that for each year of construction APCD thresholds would be exceeded; however, the Ventura County Air Quality Assessment Guidelines do not count construction emissions toward thresholds of significance because they end when the project is constructed. These types of emissions must be mitigated to the greatest amount feasible.

8-1

Toxic air emissions are discussed on Page 4.3-23. This discussion indicates that diesel particulate carcinogenic risks from the project would be 0.87 cancers/million; the APCD

8-2

threshold for significance is 10/million. Therefore, impacts are less than significant because carcinogenic risks do not exceed the threshold.

8-2

Air impact mitigation is addressed in Section 4.3.6, Mitigation Measures (Page 4.3-28). This section presents mitigation of air impacts during grading, excavation and construction as well as mitigation of area source emissions and mobile source emissions during long-term operation of the project. Mitigation Measures AQ-1, AQ-2, AQ-3 and AQ-5, AQ-6, AQ-9, AQ-10 and AQ-11 will address short-term impacts from the activities; AQ-4 cites development of a Fugitive Dust Control Plan to be approved by APCD. We look forward to reviewing the Plan when it is developed.

8-3

Mitigation of operational emissions is presented in Measures AQ-12, AQ-13, and AQ-14. Measure AQ-13 refers to a Transportation Demand Management plan for approval by the City and APCD. The sixth element of this measure (Page 4.3-31) includes traffic light synchronization on streets impacted by project development. We recommend that the contributions are not to be used for traffic engineering projects, including signal synchronization, intersection improvements, and channelization, as the benefits from these projects are primarily traffic-related and not air quality-related.

8-4

Please note also that in the Existing Local Air Quality discussion (Page 4.3-7) the discussion on monitoring stations in Ventura County references a monitoring station on Anacapa Island. This station is no longer in use and the discussion should be revised to reflect this.

8-5

If you have any questions, please call me at (805) 645-1426.

Letter No. 8

Alicia Stratton
Ventura County Air Pollution Control District
Memorandum dated December 6, 2016

Response 8-1:

The comment is noted. The EIR provides mitigation measures in Section 4.3.6: Mitigation Measures, that address Construction Emissions (mitigation measures **AQ-1** through **AQ-4**), Building Construction (mitigation measures **AQ-5**), and Operational Emissions (mitigation measures **AQ-6** through **AQ-14**). The EIR notes that even after the implementation of mitigation measures, emissions of ROG and NO_x for both construction and operation would still exceed the regional construction emissions thresholds and impacts at both the Project level and cumulative level will remain significant and unavoidable after mitigation.

Response 8-2:

This comment does not address the information or analysis in the Draft EIR. No further response is required.

Response 8-3:

The comment is noted. As indicated in mitigation measure **AQ-4**, a Fugitive Dust Control Plan will be submitted to the Ventura County Air Pollution Control District (VCAPCD) for review and approval prior to the start of grading and excavation operations.

Response 8-4:

Areas of vehicle congestion have the potential to create carbon monoxide (CO) hotspots. While the mitigation is not directed at air quality improvements, signal synchronization helps coordinate traffic lights along major arterials and is used as a strategy to reduce vehicle congestion, thus indirectly potentially reducing air emissions. While this mitigation was included in the Draft EIR, no additional benefit was taken for any decrease in emissions resulting from the synchronization.

Response 8-5:

The discussion in the Draft EIR Section 4.3.1: Existing Conditions, (page 4.3-7), has been revised and includes the six monitoring stations throughout the County of Ventura: (1) El Rio; (2) Ojai; (3) Piru; (4) Simi Valley; (5) Simi Valley–Upper Air; and (6) Thousand Oaks.

VENTURA LOCAL AGENCY FORMATION COMMISSION

COUNTY GOVERNMENT CENTER • HALL OF ADMINISTRATION

800 S. VICTORIA AVENUE • VENTURA, CA 93009-1850

TEL (805) 654-2576 • FAX (805) 477-7101

WWW.VENTURA.LAFCO.CA.GOV

Dear Prospective LAFCo Applicant:

Local Agency Formation Commissions (LAFCos) are independent governmental agencies responsible for promoting orderly development through the logical formation and determination of local agency boundaries. LAFCos implement the Cortese-Knox-Hertzberg Local Government Reorganization Act of 2000 (Government Code Section 56000 et seq.), which grants them broad authority to review, consider, modify, condition, and approve or disapprove requests for changes of organization, including annexations.

In reviewing any request for a change of organization, LAFCos must consider numerous factors such as, but not limited to, land use; the need for organized community services; the effect on the cost and adequacy of services in the area and adjacent areas; the ability of the city or district to provide services; the availability of water supplies; consistency with regional transportation plans and city/county general and specific plans; and the effects on agricultural lands. In addition, LAFCos must comply with laws pertaining to environmental protection, land conservation, public records, open meetings and taxation. The Ventura LAFCo has also adopted local policies which must be given great weight as part of its consideration of proposals. These policies, along with LAFCo's operational rules and regulations, are set forth in the *Commissioner's Handbook*, which is available on the LAFCo website: www.ventura.lafco.ca.gov.

9-1

Regardless of your agency's level of familiarity or experience with the LAFCo application process, we strongly encourage all prospective applicants to consult with Ventura LAFCo staff prior to submitting an application. Although the LAFCo application requirements are generally the same for each boundary change proposal, there may be exceptions depending on the complexity, scope, and location. During the pre-application consultation, a detailed explanation of the application requirements and all information necessary to process the request will be provided. Meeting all of the requirements in the initial application submittal is the best way to minimize processing time and costs. Generally speaking, it takes between three and four months from the time an application is submitted to the time it can be recorded (for proposals that are approved). However, it can take significantly longer if the application does not include all of the required information.

Pre-application consultations are available free of charge in most cases unless multiple meetings are required. Optimally, the consultation process should occur before your agency initiates the environmental review process and well before a resolution to initiate a change of organization is adopted. Please take advantage of the LAFCo staff to help make your LAFCo experience as efficient and cost effective as possible.

Sincerely,
Ventura Local Agency Formation Commission

Letter No. 9

Ventura Local Agency Formation Commission (LAFCo)

January 3, 2017

Ms. Janna Minsk, Planning Director
City of Santa Paula
P.O. Box 569
Santa Paula, CA 94061-0569

SENT VIA E-MAIL

Subject: Notice of Availability of a Draft Environmental Impact Report (DEIR) for the Santa Paula West Business Park Specific Plan Project (SPWBPSP)

Dear Ms. Minsk:

Thank you for providing the Ventura Local Agency Formation Commission (LAFCo) with the opportunity to review the subject DEIR, and for providing us with additional time to review the document as a result of our office being short-staffed. As a responsible agency under the California Environmental Quality Act (CEQA), LAFCo is charged with ensuring that environmental documents prepared by lead agencies address the issues that relate to LAFCo's scope of authority. Please note that the Commission has not reviewed the DEIR, and these comments are solely those of the LAFCo staff.

Project Description

The City of Santa Paula is the lead agency for the project involving a specific plan that would allow for development of a business park (i.e., a combination of office, manufacturing, research and development, and other commercial uses) on an approximately 54-acre area located west of and contiguous to the City of Santa Paula. The territory is located within the "West Area 2" area planned for City expansion pursuant to the City's General Plan. The development within the proposed SPWBPSP area would receive City services, which requires that the territory be annexed to the City of Santa Paula. The majority of the project area is currently being used for agriculture, and the entire site has a County General Plan designation of Agricultural - Urban Reserve. The City's General Plan designates the project area as Mixed Use Commercial/Light Industrial.

10-1

LAFCo Law and Ventura LAFCo Policies

LAFCo's purposes are to (1) discourage urban sprawl, (2) preserve open space and prime agricultural land, (3) ensure efficient provision of government services, and (4) encourage the orderly formation and development of local agencies, such as cities (Government Code § 56301). The Ventura LAFCo has adopted local policies that it must consider when making

10-2

Ms. Janna Minsk
January 3, 2017
Page 2 of 6

decisions on reorganization proposals. Specifically, the policies found in Division 3 of the Ventura LAFCo Commissioner’s Handbook (Handbook) apply to the proposed project. The Handbook is available on the Ventura LAFCo website at www.ventura.lafco.ca.gov, and can be found under the “Policies” tab. To adequately address the subjects that are within LAFCo’s scope of authority (pursuant to Government Code § 56668), the project description and analysis in the EIR should include the following:

10-2

Request to LAFCo

Annexation of the proposal area to the City requires LAFCo approval of several changes of organization, collectively referred to as a reorganization. Therefore, the EIR should identify LAFCo as a responsible agency whose approval is required in conjunction with the development of the proposed project. The project description should include the following necessary components of the reorganization:

10-3

- Annexation to the City of Santa Paula
- Detachment from the Ventura County Resource Conservation District
- Detachment from County Service Area Nos. 32 and 33
- Detachment from the Ventura County Fire Protection District
- Detachment from the Gold Coast Transit District

Based on the project description and map exhibits included in the DEIR, the railroad (which bisects the project area) is not proposed as part of the SPWBSP or for annexation to the City. As mentioned in the comments provided by LAFCo staff to City staff on September 30, 2014, regarding the Notice of Preparation of the DEIR, exclusion of the railroad right-of-way from the proposed reorganization may be inconsistent with the Handbook policies regarding the proposed City boundary configuration [Handbook Sections 3.3.1.2(a) and 3.3.2.2(c)]. Furthermore, the contiguous segment of the railroad right-of-way should be included in the reorganization request because: (1) it appears that the project would involve realignment and/or modifications to a railroad crossing, (2) utility and drainage systems serving the project would intersect the railroad, and (3) other portions of the railroad right-of-way that are flanked on both the north and south sides by the City are located within the City’s boundaries.

10-4

The map exhibits contained in the DEIR suggest that the unincorporated portion of Telegraph Road that is contiguous to the project site and within the City’s sphere of influence is not proposed for annexation to the City. Pursuant to Handbook Section 3.2.1, roadway sections adjacent to territory proposed to be annexed shall be included in City annexation requests. Therefore, the reorganization request should include annexation of an approximately 200-foot long segment of Telegraph Road at the western edge of the project area.

10-5

Ms. Janna Minsk

Page 3 of 6

Agricultural Resources [Government Code § 56668(e)]

The DEIR's discussion of impacts to agricultural land is based on the State's Important Farmlands Inventory (IFI), and identifies 49.08 acres of farmland that would be converted to non-agricultural uses as a result of the proposed development. However, in making determinations regarding reorganization proposals, LAFCo is required to apply the definition of prime agricultural land found in Government Code § 56064, which differs from the IFI. Based on a preliminary review of the project area, it appears that the entire proposal area (i.e., approximately 54 acres) consists of prime agricultural land that would be converted to non-agricultural uses in order to accommodate the proposed development. Handbook Section 3.3.5 includes policies that apply to proposals involving the conversion of agricultural land to other uses. As the project site is located on land qualifying as prime agricultural land, in order for LAFCo to approve the reorganization, LAFCo must determine (among other things) that "insufficient non-prime agricultural or vacant land exists" within the City [Handbook Section 3.3.5.1(c)] and make findings pursuant to Section 3.3.5.2. The DEIR provides a discussion of the project pursuant to Section 3.3.5.1, but does not include an analysis of the project pursuant to Section 3.3.5.2 (Findings that Insufficient Non-Prime Agricultural or Vacant Land Exists). Although not necessarily a CEQA matter, if the EIR does not include this evaluation, LAFCo will require that it be submitted in order for the Commission to consider the reorganization request.

10-6

10-7

Despite the conclusion that impacts to agricultural land will be significant and unavoidable, the DEIR states that no mitigation measures are proposed because: (1) the City has designated the land for non-agricultural uses, (2) conservation easements do not mitigate the loss of agricultural land, (3) the City does not have a program for collection and use of agricultural mitigation fees, and (4) agricultural mitigation is not economically feasible.

10-8

CEQA does not require that feasible mitigation measures result in a less than significant impact, but instead that they "avoid, minimize, rectify, reduce or eliminate, or compensate" for the impact (CEQA Guidelines § 15370). Therefore, in order for the EIR to be in compliance with CEQA, LAFCo staff encourages City staff to incorporate into the project description and evaluate in the document mitigation measures that would reduce the potential impacts to agricultural resources. If after such evaluation no agricultural mitigation measures are proposed because they are not feasible, the analysis should provide information to support this conclusion.

In addition, LAFCo staff noted that Table ES-2 includes Mitigation Measure A-1, which requires that the conversion of prime farmland be partially mitigated through the recordation of a conservation covenant on other prime farmland, with the amount of farmland to be protected determined by the monetary value of the crops grown, not the acreage of the farmland. This mitigation measure does not appear to be discussed in the body of the DEIR and conflicts with the Agricultural Resources section of the DEIR that states no agricultural mitigation measures are proposed.

10-9

Ms. Janna Minsk

Page 4 of 6

Drainage and Flooding [Government Code §§ 56668(j)]

As discussed in the December 6, 2016, comments submitted to the City by the Ventura County Watershed Protection District (WPD), the DEIR has not adequately evaluated flooding impacts related to the development, with respect to both flooding of the project site and the drainage impacts of the development on surrounding land, uses, and drainage facilities. Handbook Section 3.3.1.2(h) discourages approval of a proposal that would accommodate new development within a hazardous area, unless the hazard can be adequately mitigated. Therefore, the EIR should include a more robust evaluation of flooding and drainage hazards as itemized in the WPD's comments.

10-10

Water Supply and Demand [Government Code §§ 56668(b), (k), and (l)]

Pursuant to the Urban Water Management Planning Act, urban purveyors with 3,000 or more connections are required to prepare (and update in years ending in 5 and 0) an Urban Water Management Plan (UWMP) in order to ensure that adequate water supplies are available to meet existing and future water demands (Water Code §§ 10617 and 10621). The analysis regarding water supply and demand contained in the DEIR comes from the City's 2010 UWMP, which is outdated. The Draft Santa Paula West Water Supply Assessment (WSA) (November 2016) states that the 5-year update for 2015 is anticipated in early 2017. According to the Water Code, 2015 UWMPs were to be updated and submitted to the Department of Water Resources by July 1, 2016. Thus, it appears that the City is not in compliance with the State Water Code. The discussion of water should be updated based on the contents of the updated UWMP.

10-11

The DEIR specifies that the project demand within the SPWBPSP will be 39.8 afy (the UWMP allocation for the entire West Area 2 Planning Area is 88.8 afy). LAFCo staff identified four instances where the estimated water demand differs from the 39.8 afy estimated elsewhere in the DEIR: (1) 39.4 afy on page 2.0-2 of the WSA, (2) 40.6 afy on page 3.0-24 of the WSA, (3) 108 afy in Figure 4 of the Domestic Water Technical Report (November 2015), and (4) 107.6 afy on page 31 of the SPWBPSP. The EIR should reconcile this data, and any erroneous information contained within the EIR and/or supporting studies should be corrected.

10-12

The WSA states that the SPWBPSP would cover approximately 43% of the 125-acre West Area 2 area. This equates to a nearly proportional amount of the water allocation for West Area 2 based on land area [approximately 45% (39.8 afy/88.8 afy)]. The EIR should clarify whether the remaining approximately 71 acres of West Area 2 is planned for development intensity similar to or less than that of the SPWBPSP such that the remaining water allotment will be sufficient for build-out of West Area 2.

10-13

The DEIR states that maximum development under the SPWBPSP at build-out would be approximately 1,264,982.4 square feet of commercial/light industrial uses and approximately 562,795.2 square feet of light industrial uses (totaling 1,827,777.6 square feet). The WSA,

Ms. Janna Minsk
January 3, 2017
Page 5 of 6

which relies on the 2010 UWMP, estimates 1,906,000 square feet of development on the entire 125-acre territory comprising West Area 2, which leaves only approximately 78,222.4 square feet of development potential on the remaining 71 acres of West Area 2. As the development appears to be greatly weighted toward the SPWBSP portion of West Area 2, the EIR should provide additional discussion regarding anticipated build-out of West Area 2.

10-13

The WSA also states that according to the City's Potable Water System Master Plan, the City plans to develop a recycled water system conveyance plan that will include a line in Telegraph Road, and that recycled water will be used within the SPWBSP project area for irrigation purposes. The City has not yet developed a recycled water master plan, recycled water infrastructure is not yet available, and the City will gradually develop a recycled water system. The project site is expected to have a recycled water demand of 17.9 afy. The EIR should include an evaluation of impacts related to the demand of 17.9 afy of potable water if recycled water does not become available for the project before development occurs.

10-14

The WSA states that long-term, gradual declines in water levels have been observed in many parts of the Santa Paula Groundwater Basin, which is the City's sole source of water supply. While the declines have been relatively minor, "they are indicative of changing hydrologic conditions in the basin that warrant further monitoring, and if the trend persists, the development of alternative basin management strategies." Further, the WSA discusses the City's proposed water demand reduction program for worst-case planning purposes related to water supply. The program includes an up to 50% decrease in water allocation based on a yearly average for metered services, with penalties charged to noncompliant users. As the SPWBSP will incorporate water conservation features and measures, the EIR should discuss whether a 50% reduction in water use will be possible for development within the SPWBSP if water supply conditions warrant such a reduction.

10-15

Affected Public Agencies [Government Code § 56668(j)]

It appears that Beckwith Road is proposed to be improved and extended across the railroad right-of-way that bisects the Specific Plan, in which case the California Public Utilities Commission (CPUC), which has the exclusive authority to approve and determine the design of new railroad crossings (Public Utilities Code § 1201), would be a responsible agency under CEQA. The CPUC generally discourages new at-grade crossings. The EIR should include an evaluation of the feasibility of any proposed railroad crossing and extension of utility systems within the railroad right-of-way.

10-16

Additional Comments

Section 6.5.1 of the draft SPWBSP states that the Planning Director would have the authority to approve certain modifications to the SPWBSP, such as "Minor expansions or reductions (10%) of the geographic area." Please note that expansion of the SPWBSP area beyond that

10-17

Ms. Janna Minsk
January 3, 2017
Page 6 of 6

provided in the currently proposed SPWBSP would likely require approval by LAFCo to amend the City's sphere of influence and annex the additional territory to the City.

The Ventura LAFCo encourages prospective applicants to meet with LAFCo staff early in the planning process (see the attached letter from the Commission). Such consultation and ongoing communication is helpful to clarify the nuances of LAFCo requirements and to avoid delays later in the process.

10-17

Again, thank you for the opportunity to review the DEIR. Please feel free to contact me if you have any questions.

Sincerely,

Andrea Ozdy
Analyst

Letter No. 10

Andrea Ozdy, Analyst
Ventura Local Agency Formation Commission (LAFCo)
Email dated January 3, 2017

Response 10-1:

This comment does not address the information or analysis in the Draft EIR. No further response is required.

Response 10-2:

This comment does not address the information or analysis in the Draft EIR. No further response is required.

Response 10-3:

The City recognizes these requirements and will submit an application with LAFCo requesting approval of these actions. Please note that as of July 8, 2018, the City of Santa Paula annexed into the Ventura County Fire Protection District and action item ‘Detachment from the Ventura County Fire Protection District’ is a no longer needed action item.

Response 10-4:

As shown in **Figure 3.0-2: Annexation Boundary**, the railroad right-of-way will be included as part of the proposed annexation. However, the California Public Utilities Commission (CPUC) has jurisdiction over some portions of the railway, and the application process will incorporate the CPUC accordingly.

Response 10-5:

As shown in **Figure 3.0-2**, the southern portion of Telegraph Road through the Project Site will be included as part of the proposed annexation. Additionally, all of Faulkner Road through the Project Site will be included as part of the annexation application.

Response 10-6:

The Project Site, excluding the railroad, is approximately 54 acres. As noted in the Section 4.2: Agricultural Resources, of the Draft EIR, the Farmland Mapping & Monitoring Program (FMMP) Important Farmland Map for Ventura County identifies a total of 44.22 acres of prime farmland and 4.88 acres of farmland of statewide importance on the site (total of 49.1 acres).

Government Code Section 56064 defines “Prime Agricultural Land” as “an area of land, whether a single parcel or contiguous parcels, that has **not been developed for a use other than an agricultural use** (emphasis added) and that meets any of the following qualifications:

- (a) Land that qualifies, if irrigated, for rating as class I or class II in the US Department of Agriculture (USDA) Natural Resources Conservation Service land use capability classification, whether or not land is irrigated, provided that irrigation is feasible.
- (b) Land that qualifies for rating 80 through 100 Storie Index Rating.
- (c) Land that supports livestock used for the production of food and fiber and that has an annual carrying capacity equivalent to at least one animal unit per acre as defined by the USDA in the National Range and Pasture Handbook, Revision 1, December 2003.
- (d) Land planted with fruit or nut-bearing trees, vines, bushes, or crops that have a nonbearing period of less than five years and that will return during the commercial bearing period on an annual basis from the production of unprocessed agricultural plant production not less than four hundred dollars (\$400) per acre.
- (e) Land that has returned from the production of unprocessed agricultural plant products an annual gross value of not less than four hundred dollars (\$400) per acre for three of the previous five calendar years.”

Approximately 4.71 acres of land located near Beckwith Road contains a farmworker housing unit and, therefore, has been developed for uses other than agriculture. Further, this area of land does not meet any of the criteria identified in the Government Code Section 56064. Therefore, 49.1 acres (53.81 acres – 4.71 acres) of the Project Site would be considered Prime Agricultural Land under Government Code Section 56064.

Response 10-7:

The Ventura LAFCo Commissioner’s Handbook includes a number of policies that apply to reorganizations. The consistency of the Project with several of these policies was assessed in Section 4.10, Land Use, of the Draft EIR. The analysis of policies as presented in the Draft EIR is expanded below.

SECTION 3.3.1 GENERAL STANDARDS FOR ANNEXATION TO CITIES AND DISTRICTS

3.3.1.1 Factors Favorable to Approval:

- a. *The proposal would eliminate islands, corridors, or other distortion of existing boundaries.*

The proposed Project would extend the existing City boundary and would not create any islands of unincorporated territory or distort the existing boundary of the City.

- b. *The affected territory is urban in character or urban development is imminent, requiring municipal or urban-type services.*

The Project Site is located within the City's Sphere of Influence (SOI) and has been identified as an expansion area within the City's General Plan since 1998 to meet the need for additional light industrial and business park land in the City. Because the area is currently undeveloped, future development would require the extension of urban services.

- c. *The affected territory can be provided all urban services by the city or district as shown by the city's or district's service plans and the proposal would enhance the efficient provision of urban services.*

Extensions of municipal services are needed to support the range and intensities of land uses envisioned for this area by the City's General Plan, and the City of Santa Paula will provide services.

The Santa Paula Water Master Plan plans for the expansion of West Area 2, stating:

The water demands of West Area 2 are not expected to be significant, and are not expected to affect the overall infrastructure requirements for the system. However, fire flow needs could be substantial, depending on the size and types of building that may be proposed for this commercial area. To supply the required fire flows, a pipeline that crosses the freeway will likely be needed of significant size (12 or 16-inch). When the plans for the development are available, and water and firefighting needs are better defined, a detailed water system analysis is recommended.²

The Santa Paula Wastewater Master Plan also provides for wastewater service for West Area 2 to meet a projected wastewater average dry weather flow of 0.1088 million gallons per day (mgd).³

- d. *The proposal is consistent with state law, adopted spheres of influence, applicable general and specific plans, and these policies.*

The Project Site is located within the City's SOI and is identified as an expansion area the City's General Plan. The proposed Project would be consistent with the City of Santa Paula General Plan and Municipal Code.

2 Boyle Engineering Corporation, *City of Santa Paula Potable Water System Master Plan* (Final; October 2005), 127–128, <http://www.ci.santa-paula.ca.us/PubWorks/PotableWaterMasterPlanOct2005.pdf>.

3 Boyle Engineering Corporation, *City of Santa Paula Wastewater System Master Plan* (September 2005), Table 3-2, <http://ci.santa-paula.ca.us/PubWorks/WASTEWATERMASTERPLANSEPTEMBER2005.pdf>.

- e. *The proposal is for the annexation of city or district owned property, used or to be used for public purposes.*

The Project does not include City- or district-owned property.

As shown, the proposed Project is consistent with factors (a) through (d), and factor (e) does not apply to the proposed Project.

3.3.1.2 Factors Unfavorable to Approval:

- a. *The proposal would create or result in corridors, peninsulas, or flags of city or district area or would otherwise cause or further the distortion of existing boundaries.*

The proposed Project would extend existing City boundaries and would not create islands of unincorporated territory.

- b. *The proposal would result in a premature intrusion of urbanization into a predominantly agricultural or rural area.*

The Project Site is located within the City's SOI and has been identified as an expansion area in the City's General Plan since 1998 to meet the need for light industrial and business park land in the City and, for this reason, annexation of the Project Site at this time would not result in the premature urbanization of a predominantly agricultural or rural area.

- c. *The proposal is inconsistent with state law, adopted spheres of influence, adopted general or specific plans, adopted habitat conservation and/or restoration plans, other applicable plans adopted by any governmental agency, or these policies.*

The Project Site is located within the City's SOI and is identified as an expansion area the City's General Plan. The proposed Project would be consistent with the City of Santa Paula General Plan and Municipal Code. There are no habitat conservation plans or other applicable plans adopted by other governmental agencies the Project is inconsistent with.

- d. *For reasons of topography, distance, natural boundaries, or like considerations, the extension of services would be financially infeasible, or another means of supplying services by acceptable alternatives is preferable.*

The proposed Project is adjacent to existing uses within the City that currently utilize services. Services can be extended cost effectively to the proposed Project Site from adjacent developed areas in the City of Santa Paula in accordance with the City's utility master plans in

- e. *Annexation would encourage a type of development in an area that due to terrain, isolation, or other economic or social reason, is not in the public interest.*

The Project Site is relatively flat and borders developed portions of the City of Santa Paula to the east. The Project Site is located within the City's SOI and has been identified as an expansion area in the City's General Plan since 1998. Annexation of the site would be in the public interest.

- f. *The proposal appears to be motivated by inter-agency rivalry or other motives not in the public interest.*

The Project would be consistent with the Guidelines for Orderly Development that provide for development to occur within the cities and not within the unincorporated County. The Project proposes to annex land that has been identified within the City's General Plan and SOI and is proposed for expansion within the General Plan.

- g. *The proposed boundaries do not include logical service areas or are otherwise improperly drawn.*

The proposed Project would not create distorted boundaries and would extend existing boundaries as provided for in the SOI. Infrastructure improvements and extension of public services would be extended in an efficient manner.

- h. *The proposal area would accommodate new development and includes a tsunami inundation zone, wildfire hazard zone, FEMA designated floodway or floodplain, or other hazardous area designated by federal, state or local public agencies, unless the Commission determines that the hazard or hazards can be adequately mitigated.*

The proposed Project would not be located in a tsunami inundation zone, wildfire hazard zone, or other hazardous area designated by federal, state or local public agencies. As indicated in the Draft EIR, the western portion of the Specific Plan site located adjacent to Adams Creek is currently located within a FEMA-designated 100-year floodplain area. However, based on a review of historic flooding, existing contours, and site features, the site is not subject to flooding, and a CLOMR will be processed.

- i. *The proposal will result in an unacceptable significant adverse impact(s) to the environment as determined by the Commission.*

Mitigation is identified in the Final EIR for all significant impacts identified for the Project including Agricultural Resources, Air Quality, Biological Resources, Cultural Resources, Geology and Soils, Hazards and Hazardous Materials, Noise, Transportation and Traffic, and Utilities.

As shown, the proposed Project would not result in any conditions that would be unfavorable as outlined in the factors (a) through (i).

SECTION 3.3.2 GENERAL BOUNDARY CRITERIA

3.3.2.1 LAFCo Favors Applications with Boundaries that do the Following:

- a. *Create logical boundaries that coincide with existing and planned service areas and, where possible, eliminate previously existing islands.*

The proposed Project would create logical municipal service boundaries within the City's established SOI. The Project Site is within an area where the City has planned for the provision of urban services.

- b. *Follow natural and man-made features, such as ridge lines drainage areas, watercourses, and edges of right-of-way, provided they coincide with lines of assessment or ownership, or are described by metes and bounds legal descriptions which can easily be used for mapping lines of assessment or ownership.*

The Project extends to a natural boundary on the west, the Adams Barranca, and coincides with existing rights-of-way and parcel boundaries.

- c. *Include adjacent urbanized areas which are receiving or which may require urban services such as public water and/or sewer services.*

The Project Site is currently undeveloped land within the City's SOI and is not adjacent to any existing unincorporated areas receiving or requiring urban services.

As shown, the proposed Project is consistent with factors (a) and (b), and factor (c) does not apply.

3.3.2.2 LAFCo Discourages Applications with Boundaries that:

- a. *Split neighborhoods or divide an existing identifiable community, commercial district, or other area having a social and economic identity.*

The proposed Project would not split or divide any existing communities, commercial districts, or other areas having a social and economic identity.

- b. *Create areas where it is difficult to provide services.*

The proposed Project would create logical municipal service boundaries within the City's established SOI.

- c. *Create boundaries which result in islands, peninsulas, flags, "pinpoint contiguity," "cherry stems," or cause, or further, the distortion of existing boundaries.*

The proposed Project would extend existing City boundaries and would not create boundaries which result in islands, peninsulas, flags, "pinpoint contiguity," "cherry stems," or cause, or further, the distortion of existing boundaries.

- d. *Are drawn for the primary purpose of encompassing revenue-producing territories.*

The Project would be consistent with the City's existing General Plan that identifies this area for urban expansion to accommodate City growth through 2020. The General Plan identifies this area for industrial and research and development uses.

As shown, the proposed Project would not result in any conditions that would be discouraged by LAFCo as outlined in factors (a) through (d).

SECTION 3.3.5 AGRICULTURE AND OPEN SPACE PRESERVATION

3.3.5.1 Findings and Criteria for Prime Agricultural and Existing Open Space Land Conversion

LAFCo will approve a proposal for a change of organization or reorganization which is likely to result in the conversion of prime agricultural or existing open space land use to other uses only if the Commission finds that the proposal will lead to planned, orderly, and efficient development. For the purposes of this policy, a proposal for a change of organization or reorganization leads to planned, orderly, and efficient development only if all of the following criteria are met:

- a. The territory involved is contiguous to either lands developed with an urban use or lands which have received all discretionary approvals for urban development.*

The Project Site is adjacent to urbanized land within the City of Santa Paula to the east. Additionally, to the north of the Project Site, beyond Telegraph Road, are additional areas containing urban uses.

- b. The territory is likely to be developed within 5 years and has been pre-zoned for nonagricultural or open space use. In the case of very large developments, annexation should be phased wherever possible.*

The Project Site has been designated in the City's General Plan as an expansion area since 1998. With approval of the proposed Project, the site will be pre-zoned for nonagricultural use.

- c. Insufficient non-prime agricultural or vacant land exists within the existing boundaries of the agency that is planned and developable for the same general type of use.*

The City completed an inventory of vacant land within the City limits for the City's 2013-2021 Housing Element Update. This inventory identified approximately 60 acres of vacant, residentially zoned land, including several small vacant commercial properties, within the current city limits. Those vacant sites are not contiguous and are dispersed throughout the City.

In addition to these 60 acres of vacant land, the City has adopted Specific Plans for the East Area 1 and East Gateway Specific Plan Areas on the eastern edge of the City. Each of these Specific Plans designates small areas for business park uses. The East Gateway Specific Plan area is, however, primarily planned for development with community level retail commercial uses.

The small amount of vacant land available inside the City limits and available for development with light industrial and business park uses is not sufficient to meet the objectives in the City's General Plan. The West Area Expansion Area is the primary area for additional light industrial uses identified in the City's General Plan. There is insufficient non-prime agricultural or vacant land within the City's existing boundaries that is planned and developable for the same

general type of use. As the parcel of vacant land are dispersed and not contiguous, they do not provide sufficient site area to enable orderly, efficient and planned development of the commercial and light industrial uses envisioned for the Project area in the Santa Paula General Plan.

Other undeveloped land is available within the City's Sphere of Influence, which includes other expansion areas identified in the Santa Paula General Plan. They include Adams and Fagan Canyons located well north of SR 126 and have limited access. Because of the existing characteristics of these expansion areas, the Santa Paula General Plan limits development in Adams Canyon to single-family homes, a destination resort hotel, and a golf course, along with public facilities. Development permitted in Fagan Canyon by the General Plan includes single-family residences with supporting public facilities and a limited amount of neighborhood commercial uses. As such, these areas do not have the locational characteristics required for light industrial uses, or are not large enough to accommodate these uses.

- d. The territory involved is not subject to voter approval for the extension of services or for changing general plan land use designations. Where such voter approval is required by local ordinance, such voter approval must be obtained prior to LAFCo action on any proposal unless exceptional circumstances are shown to exist.*

The affected territory is not subject to voter approval for the extension of services or for the proposed minor changes in existing City General Plan land use designations. The proposed Specific Plan would include the annexation of land located within the City Urban Restriction Boundary (CURB). Measure L6 is not triggered by the proposed Project.

- e. The proposal will have no significant adverse effects on the physical and economic integrity of other prime agricultural or existing open space lands.*

The Project will be adjacent to other existing agricultural or open space lands for which the Project has been designed to address compatibility, including a buffer along the Adams Barranca to the west, and does not include uses such as residential, schools, and other sensitive receptors immediately adjacent to agricultural operations.

As shown, the proposed Project is consistent with factors (a) through (e).

3.3.5.2 Findings that Insufficient Non-Prime Agricultural or Vacant Land Exists

The Commission will not make affirmative findings that insufficient non-prime agricultural or vacant land exists within the boundaries of the agency unless the applicable jurisdiction has prepared a detailed alternative site analysis which at a minimum includes:

- a. An evaluation of all vacant, non-prime agricultural lands within the boundaries of the jurisdiction that could be developed for the same or similar uses.*

The proposed Project would develop approximately 54 acres of agricultural land. As discussed in Section 4.10: Land Use, of the Draft EIR, there is insufficient non-prime agricultural or vacant land within the City's existing boundaries that is planned and developable for the same general type of use.

The City conducted an inventory of vacant land conducted for the City's 2013–2021 Housing Element Update identified approximately 60 acres of vacant, properties within the current City limits, not including land in the City's East Area 1 and East Gateway Specific Plan areas. Those vacant sites are dispersed throughout the City, include sites zoned for residential uses, and do not provide sufficient contiguous land to allow for the orderly, efficient, and planned development of the commercial and light industrial uses envisioned for the Project area in the Santa Paula General Plan.

- b. An evaluation of the re-use and redevelopment potential of developed areas within the boundaries of the jurisdiction for the same or similar uses.*

The City completed an inventory of vacant land within the City limits for the City's 2013-2021 Housing Element Update. This inventory identified approximately 60 acres of vacant, residentially zoned land, including several small vacant commercial properties, within the current city limits. Those vacant sites are not contiguous, are dispersed throughout the City, and are not suitable for development with the type of light industrial and business park uses that would be accommodated by this proposed Project.

- c. Determinations as to why vacant, non-prime agricultural lands and potential re-use and redevelopment sites are unavailable or undesirable for the same or similar uses, and why conversion of prime agricultural or existing open space lands are necessary for the planned, orderly, and efficient development of the jurisdiction.*

As discussed above, the City does not have sufficient land available within its current City limits to accommodate the light industrial uses this Project would allow. Four expansion areas, Adams Canyon, Fagan Canyon, West Area 2, and one planning area, East Area 2, are identified in the City's General Plan to accommodate needed growth. This proposed Project is located in the West Area 2 Expansion Area, which is the primary area planned to meet the City's need for additional light industrial land.

As shown, the proposed Project is consistent with factors (a) through (c).

3.3.5.3 Impacts on Adjoining Prime Agricultural or Existing Open Space Lands

In making the determination whether conversion will adversely impact adjoining prime agricultural or existing open space lands, the Commission will consider the following factors:

- a. The prime agricultural and open space significance of the territory and adjacent areas relative to other agricultural and existing open space lands in the region.*

Approximately 49 acres of the 54-acre Project Site are currently under agricultural cultivation

The Project Site includes 49.1 acres of land meeting the definition of prime agricultural land in Government Code Section 56064.

The Project Site contains approximately 44.20 acres of prime farmland, 4.88 acres of farmland of Statewide importance, and 4.48 acres of urban and built-up land as designated on the current State Important Farmland Map.

As of 2016, Ventura County had approximately 118,508 acres of important farmland, which included 40,976 acres of prime farmland and 32,992 acres of farmland of Statewide importance.⁴ The 44.20 acres of prime farmland and 4.88 acres of farmland of Statewide importance currently under agricultural cultivation within the Project Site account for 0.1 percent of the total prime farmland in Ventura County and 0.01 percent of the total of farmland of Statewide importance within the County.

Additionally, the land directly west of the Project Site is part of the Ventura-Santa Paula Greenbelt and will not be annexed or developed. Annexation and development of the Project Site in accordance with the proposed Specific Plan, which includes a buffer to ensure compatibility with agricultural land around the site, will not affect the large amount of remaining high quality agricultural land in the County.

b. The economic viability of the prime agricultural lands to be converted.

The Project Site is currently farmed by two organizations: Bender Farms and McGrath Farms. Bender Farms grows avocados on approximately 9.2 acres of land and herbs on approximately 12.3 acres. McGrath Farms grows a variety of row crops on approximately 27.5 acres of land. The proposed Project contains 44 acres of prime agricultural land that would be converted. The County of Ventura has determined that prime agricultural lands in the County are highly productive and are capable of supporting commercially viable agricultural operations on parcels as small as 9 acres.⁵ At 44 acres, continued agricultural operations are economically viable.

c. The health and well-being of any urban residents adjacent to the prime agricultural lands to be converted.

The health and well-being of urban residents adjacent to the proposal area are unlikely to be impacted as a result of the conversion of the agricultural land within the proposed SOI amendment. The existing residential development to the north is separated by Telegraph Road, which has a width of approximately 50 feet, from the Project Site. The proposed light industrial and business park uses would be developed in accordance with the development and design standards in the proposed Specific Plan, will be compatible with the nearest residential uses, and will not affect the health or well-being of the residents of this neighborhood

4 California Department of Conservation, "Farmland Mapping and Monitoring Program, Ventura County, Land Use Conversion Table," available at <http://www.conservation.ca.gov/dlrp/fmmp/Pages/Ventura.aspx>.

5 Ventura County Board of Supervisors, *Ventura County Land Conservation Act Guidelines*, (adopted November 22, 2011; December 8, 2015, ed.), <https://docs.vcrma.org/images/pdf/planning/programs/lca/LCA-Guidelines.pdf>.

d. The use of the territory and the adjacent areas.

Residential and agricultural uses surround the Project Site. To the north of the Project Site and Telegraph Road are primarily single-family residences accessed from Country View Court, as well as a mobile home park accessed from Valencia Way. The southern portion of the Project Site is bound by SR 126; just beyond the freeway exist agricultural uses that grow various row crops, avocados, and citrus, and contain a limited number of single-family residential units within some of the properties. To the east of the Project Site, along Beckwith Road, are light industrial uses to the east, including offices, warehouse buildings, construction equipment storage, and maintenance facilities. The Adams Barranca is located adjacent to the western boundary of the Project Site; agricultural uses and limited single-family residences, consisting of orchards and a limited number of livestock, are located immediately west of the Adams Barranca.

Similar industrial uses currently exist to the east of the Project boundary. Additionally, man-made or natural boundaries would separate uses from the north, south, and west portions of the Project Site. The proposed light industrial and business park uses would be developed in accordance with the development and design standards in the proposed Specific Plan, will be compatible with the surrounding uses.

e. Whether public facilities related to the proposal would be sized or situated so as to facilitate the conversion of prime agricultural or existing open space land outside of the agency's sphere of influence, or will be extended through prime agricultural or existing open space lands outside the agency's sphere of influence.

The City has sewer and water master plans designed to serve uses allowed by the City's General Plan, including the uses in the West Area 2 Expansion Area, which includes the Project Site. Sewer and water facilities would be provided to serve the site consistent with these master plans and would not be sized to accommodate additional growth. The Project would also not involve any road improvements that could induce growth of adjacent agricultural or open space land.

f. Whether natural or man-made barriers serve to buffer prime agricultural or existing open space lands outside of the agency's sphere of influence from the effects of the proposal.

The west portion of the Project Site will have a buffer between the Adams Barranca and the proposed Project, which will create a buffer between the existing prime agriculture to the west and the proposed Project Site. Additionally, Faulkner Road, and the 126 Freeway, places a buffer between the proposed Project and the agricultural land to the south of the Project Site.

g. Applicable provisions of local general plans, applicable ordinances that require voter approval prior to the extension of urban services or changes to general plan designations, Greenbelt Agreements, applicable growth-management policies, and statutory provisions designed to protect agriculture or existing open space.

The affected territory is not subject to voter approval for the extension of services or for the proposed minor changes in existing City General Plan land use designations. The proposed

Specific Plan would include the annexation of land located within the City's voter approved CURB. Measure L6 is not triggered by the proposed Project.

h. Comments and recommendations by the Ventura County Agricultural Commissioner.

No comments or recommendations directly involving the Project were received from the Agricultural Commissioner. In addition, the Project is consistent with the Agricultural Policy Advisory Committee's Agricultural/Urban Buffer Policy, which requires new dwellings, nonagricultural work sites, and ongoing outdoor public activities that may potentially conflict with agricultural operations to include a buffer/setback and fencing. The proposed Project will provide a buffer zone adjacent to the Adams Barranca to the west and is separated from adjacent lands by existing roadways (Faulkner Road to the south, Beckwith Road to the east, and Telegraph Road to the north).

As shown, the proposed Project does not conflict with factors (a) thru (h).

3.3.5.4 Territory Subject to a Land Conservation Act (Williamson Act) Contract

LAFCo will not approve a proposal which includes the annexation of territory subject to an active Land Conservation Act contract to a city or special district that provides or would provide facilities and/or services other than those that support the land uses that are allowed under the contract. For purposes of this section, an active Land Conservation Act contract includes a contract for which a notice of non-renewal has been filed.

The proposed Project is consistent with Policy 3.3.5.4. The proposed Project does not contain any parcels subject to a Williamson Act contract.

Response 10-8:

Under Government Code Section 56064, 49.1 acres of the Project Site would be considered Prime Agricultural Land. As discussed above, implementation of the proposed Project would convert 44.20 acres of Prime Farmland and 4.88 acres of Farmland of Statewide Importance to urbanized land uses.

Mitigation considered by the City to mitigate the impact of the Project on agricultural land is discussed below

Various measures have been developed by the California Department of Conservation (DOC),⁶ as well as by other federal and State entities nationwide, to protect farmland and support the economic viability of agriculture. These measures were considered by the City. The DOC encourages agricultural districts, conservation easements, differential assessment, purchase of agricultural conservation easements (PACE), right-to-farm laws, use of the Land Evaluation and Site Assessment (LESA) model, transfer of development rights (TDR), and the Farmland Protection Policy Act (FPPA). Additionally, to combat the

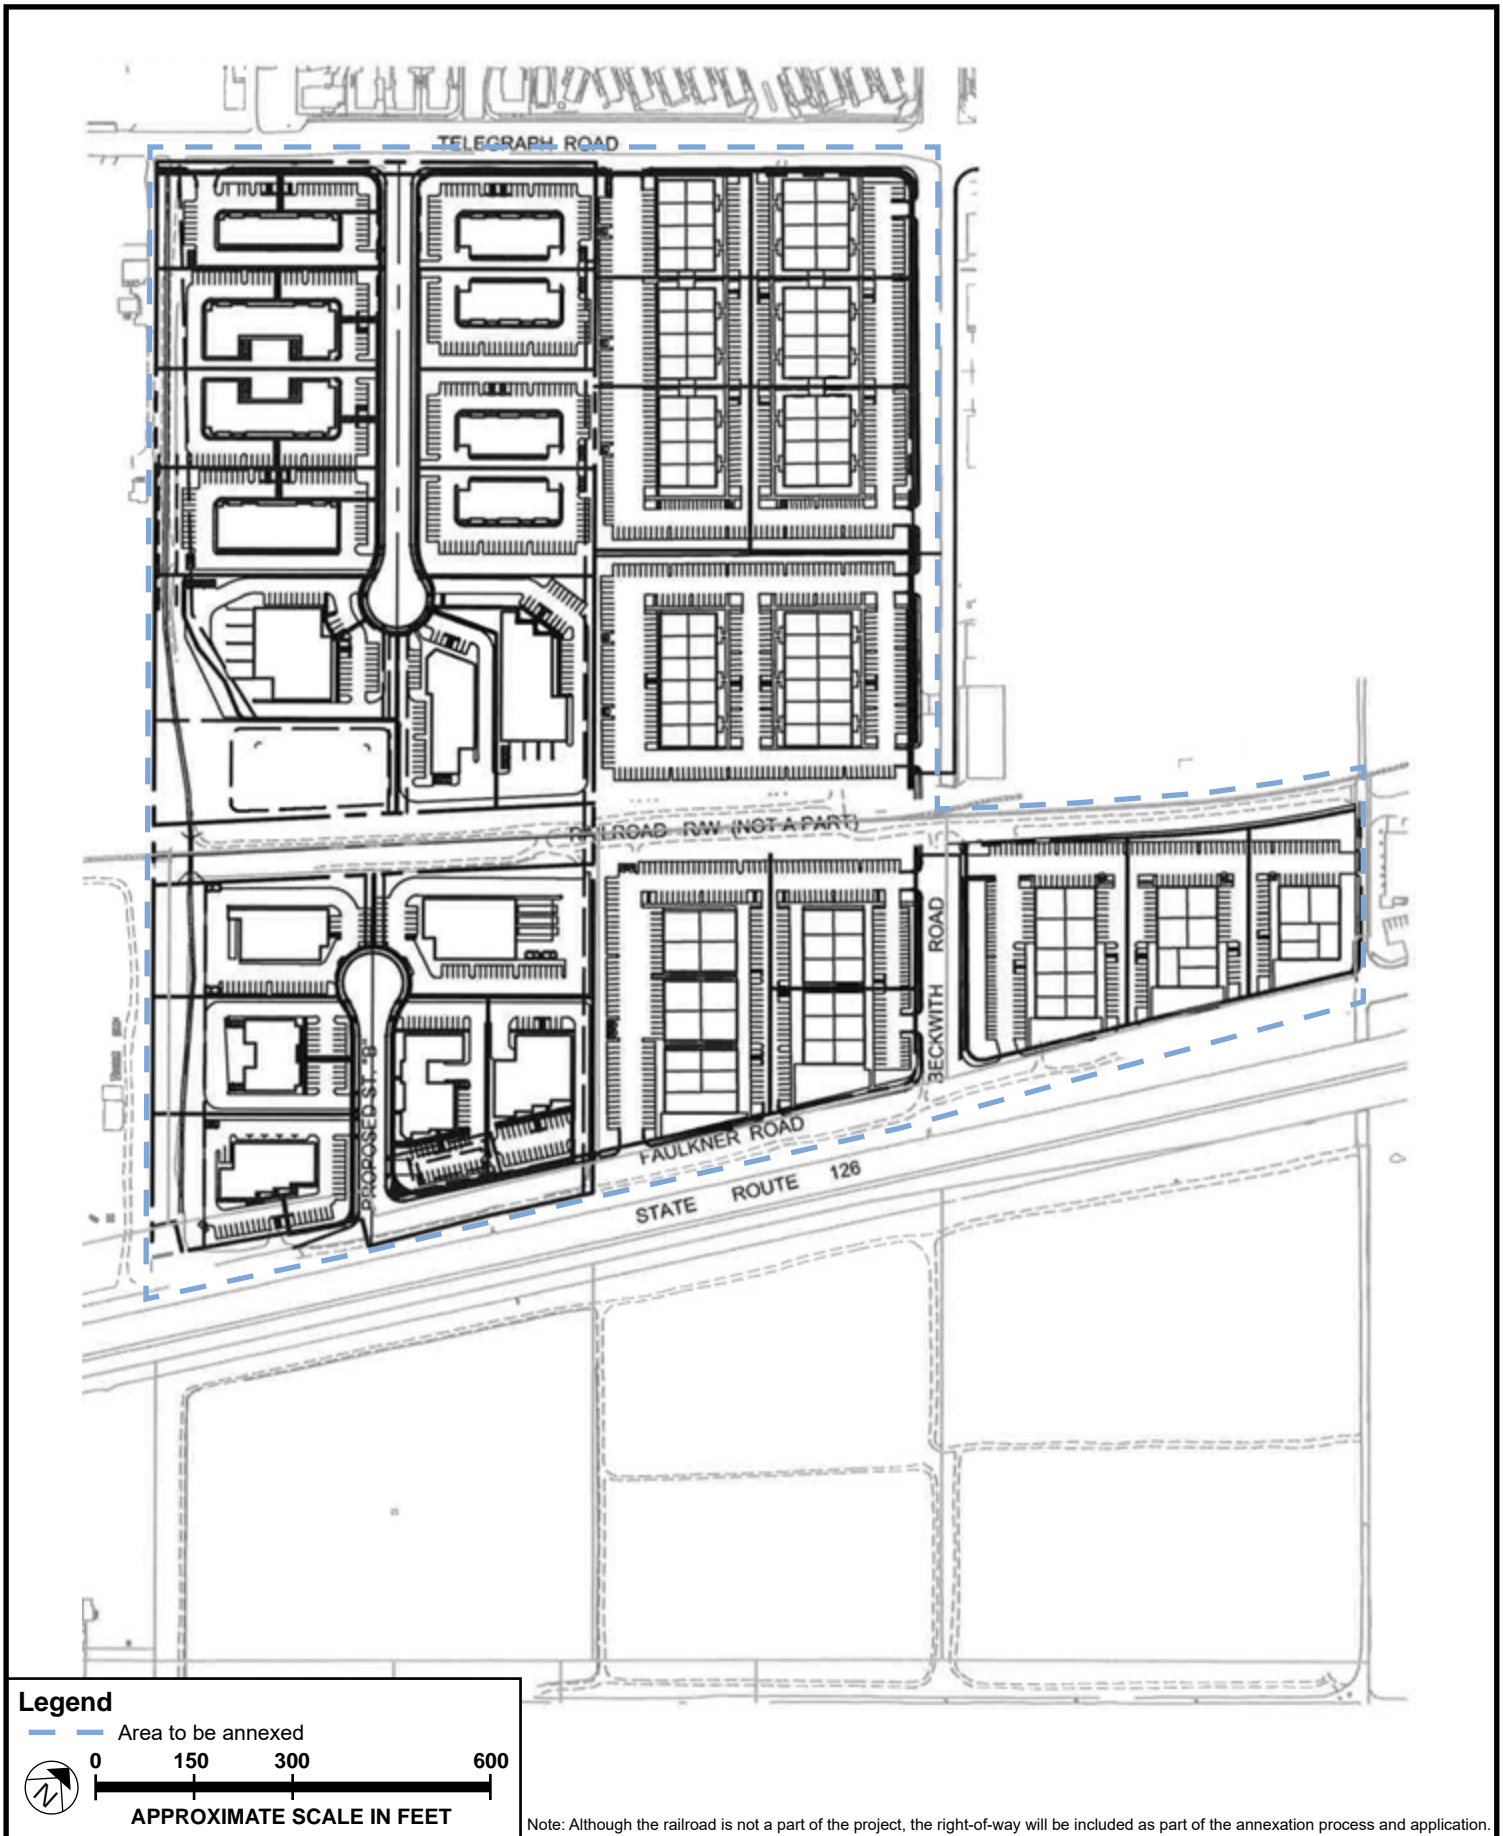

6 California Department of Conservation, "Welcome to the Division of Land Resource Protection," <http://www.conservation.ca.gov/dlrp/>.

development of residential and commercial uses adjacent to existing agricultural land, the DOC suggests that measures such as setbacks, berms, greenbelts, and open space areas, be developed between urbanized uses and existing agricultural land.

Some of the techniques developed have resulted in programs that are enacted and administered at the State level, while other are used primarily by local governments. These measures are described in **Table 3.0-2: Farmland Protection Tool Box**, and are taken from the Farmland Information Center (FIC),⁷ a clearinghouse for information about farmland protection and stewardship.

As shown in **Table 3.0-2**, the City has considered and evaluated the feasibility of a variety of farmland protection measures to mitigate the impacts of the Project on agricultural land.

7 The Farmland Information Center is a public/private partnership between the US Department of Agriculture's Natural Resources Conservation Service and the American Farmland Trust.

FIGURE 3.0-2

Annexation Boundary

**Table 3.0-2
Farmland Protection Tool Box**

Tool or Technique	Description	Applicability
Agricultural District Programs	Allows farmers to form special areas where commercial agriculture is encouraged and protected. Programs are authorized by state legislatures and implemented at the local level. Enrollment in agricultural districts is voluntary. In exchange for enrollment, farmers receive a package of benefits, which varies from state to state. Agricultural district programs help create a more secure climate for agriculture by preventing local governments from passing laws that restrict farm practices and by enhancing protection from private nuisance lawsuits. California enacted the California Land Conservation Act (also known as the Williamson Act) in 1965. It allows landowners within locally designated “agricultural preserves” to sign renewable 10-year contracts with local governments. Landowners agree to restrict use of property within preserves to agriculture or open space for the term of the contract. In return, the land is assessed at its agricultural use value, providing participants with significant property tax relief.	The Williamson Act is available in the State. The Project does not involve the development of any land subject to the Williamson Act; therefore, that this tool is not applicable.
Agricultural Protection Zoning (APZ)	Refers to county and municipal zoning ordinances that support and protect farming by stabilizing the agricultural land base. APZ designates areas where farming is the primary land use and discourages other land uses in those areas. APZ limits the activities permitted in agricultural zones. The most restrictive regulations prohibit any uses that might be incompatible with commercial farming.	Available in the County of Ventura through the Greenbelt Program, which (1) protects open space and agricultural lands; and (2) reassures property owners located within these areas that lands will not be prematurely converted to agriculturally incompatible uses. There are greenbelts either side of Santa Paula: The Santa Paula–Fillmore Greenbelt located east of Santa Paula and the Ventura–Santa Paula Greenbelt, which is located directly west of the proposed Project Site. The Project Site is outside these greenbelts and in an expansion area as defined in the City’s General Plan. This tool is not applicable.
Conservation Easements	Deed restrictions that landowners voluntarily place on their land to protect important resources. Conservation easements are used by landowners to authorize a qualified conservation organization or public agency to monitor and enforce the restrictions set forth in the agreement. These easements are designed to keep land available for agriculture. Grantors retain the right to use their land for farming, ranching, and other purposes that do not interfere with or reduce agricultural viability; hold title to their properties; and may restrict public access, sell, give, or transfer their property as they	Potentially applicable tool.

Tool or Technique	Description	Applicability
	desire. Producers also remain eligible for any state or federal farm program for which they are qualified before entering into the conservation agreement.	
Cluster Zoning	A form of zoning that allows or requires houses to be grouped together at densities that exceed the usual requirements. By clustering houses on a small portion of a larger parcel, cluster zoning can be used to protect open space. This technique is also called cluster or conservation development. In the context of farmland protection, cluster zoning can allow or require new houses to be sited in wooded areas or on less-productive soils while keeping more-productive land available for agriculture. However, some question the effectiveness of cluster zoning as a farmland protection tool because the use of remaining open space may be limited. Rather than relying on cluster zoning to keep land available for agriculture, some communities use this form of zoning between urban and rural areas.	Not offered in the County of Ventura and not applicable because this tool addresses housing and the proposed Project is industrial.
Growth Management Laws	Designed to control timing and phasing of urban growth and to determine the types of land use that would be permitted at the local and regional levels. Growth management laws take a comprehensive approach to regulating the pattern and rate of development, and set policies to ensure that most new construction is concentrated within designated urban growth areas or boundaries (UGBs). These laws direct local governments to identify lands with high natural resource, economic, and environmental value, and protect them from development. Some growth management laws require that public services—such as water and sewer lines, roads, and schools—be in place before new development is approved. Others direct local governments to make decisions in accordance with comprehensive plans that are consistent with plans for adjoining areas.	The County of Ventura and the City of Santa Paula implement urban growth boundaries via voter-approved urban growth boundaries, including the Save Open Space and Agricultural Resources (SOAR) program. Additionally, agricultural boundaries are protected via the Greenbelt Program as discussed above under Agricultural Protection Zoning. The Project is consistent with these programs because the Project Site is inside the City’s voter approved CURB. This tool is applicable.
Right-to-Farm Regulations	State right-to-farm regulations are intended to protect farmers and ranchers from nuisance lawsuits. Some statutes protect farms and ranches from lawsuits filed by neighbors who moved in after the agricultural operation was established. Others protect farmers who use generally accepted agricultural and management practices and comply with federal and state laws. Many right-to-farm laws also prohibit local governments from enacting ordinances that would impose unreasonable restrictions on agriculture. A growing number of counties and municipalities are passing their own right-to-farm legislation to supplement the protection provided by state law.	The County of Ventura has implemented various Right-to-Farm regulations to help ensure farming can continue even with urban neighbors. This tool is applicable.
Transfer of Development Rights (TDR)	Enable the transfer of development potential from one parcel of land to another. TDR programs are typically established by local zoning ordinances. In the context of farmland protection, TDR is often used to shift development from agricultural land to designated growth zones located closer to municipal services. TDR is also known as transfer of development credits and transferrable development units.	Not applicable because a TDR program is not available in the City of Santa Paula.

Tool or Technique	Description	Applicability
Farmland Protection Policy Act (FPPA)	Congress enacted the FPPA as a subtitle to the 1981 Farm Bill. The FPPA is intended to minimize the extent to which federal activities contribute to the unnecessary and irreversible conversion of agricultural land to nonagricultural uses. It also seeks to ensure that federal policies are administered in a manner that would be compatible with state, local, and private policies that protect farmland. Some benefits of the FPPA include (a) an increase in national awareness about farmland protection; and (b) the ability of a federal agency to withhold financial assistance from private parties and state and local governments undertaking projects that would convert farmland.	Does not apply to the proposed Project as the Project does not involve any federal activities. This tool is not applicable.
Farm and Ranch Lands Protection Program (FRPP)	A voluntary federal conservation program that provides matching funds to eligible entities to buy permanent conservation easements on farm and ranch land. The US Department of Agriculture (USDA) Natural Resources Conservation Service (NRCS) manages the program.	This particular federal program is not available in the County of Ventura. However, a similar conservation easement tool is available. Mitigation measure AG-1 offers two options for the Applicant, one of which includes securing a conservation easement in perpetuity on land designated as Prime Farmland or Important Farmland within the State of California. The other option would allow the Applicant to contribute funds to a local, regional, or Statewide organization whose purpose is to acquire agricultural conservation easements for Prime Farmland and Important Farmland and has demonstrated a successful track record in doing so, over at least 5 years.
Subdivision Ordinances	Subdivision ordinances govern the division of larger parcels of land and give local officials the authority to review and make decisions about proposed subdivisions. In the context of farmland protection, subdivision ordinances can require review of potential impacts on agricultural resources; establish design standards, including setbacks and buffers and clustering of new houses; and authorize local officials to suggest alternatives or mitigation measures or to deny projects based on the impact to agriculture.	Implemented by the Lead Agency and part of the environmental review process. The City's General Plan requires preparation of Specific Plans for expansion areas to ensure comprehensive planning to make certain that land use is compatible. This is done concurrently with review of the proposed subdivision. This tool is applicable.
Land Evaluation and Site Assessment (LESA)	LESA is a numeric rating system created by the USDA NRCS to evaluate a parcel's relative agricultural importance. It is usually based on land capability classes, Important Farmland classes, soil productivity ratings, and/or soil potential ratings. The California Department of Conservation has employed the LESA model as a tool to determine impacts associated with converting agricultural land to urbanized land.	Available and allowed by CEQA as an alternative method for analyzing agriculture. The City utilizes LESA to determine the relative agricultural importance of agricultural land when appropriate. Given that the Project Site is identified as State Important Farmland and meets the Prime Agricultural Land Definition in the Government Code, the City determined that

Tool or Technique	Description	Applicability
		preparation of LESA analysis was not warranted. This tool is not applicable to the Project.
<p>The California Land Conservation Act of 1965 (Williamson Act)</p>	<p>The California Land Conservation Act of 1965—commonly referred to as the Williamson Act—enables local governments to enter into contracts with private landowners for the purpose of restricting specific parcels of land to agricultural or related open space use. In return, landowners receive property tax assessments which are much lower than normal because they are based upon farming and open space uses as opposed to full market value.</p> <p>State funding was provided in 1971 by the Open Space Subvention Act, which created a formula for allocating annual payments to local governments based on acreage enrolled in the Williamson Act Program. Source: Farmland Information Center, a partnership between the USDA NRCS and American Farmland Trust, <http://www.farmlandinfo.org>. Accessed June 2017.

Several of the farmland protection tools identified in **Table 3.0-2**—including agricultural district programs, agricultural protection zoning (APZ), cluster zoning, transfer development rights, and implementation of the FPPA and the Farm and Ranch Lands Protection Program—were not analyzed for the reasons listed above. In summary, the majority of these tools are not available or applicable in the County of Ventura or the City of Santa Paula, and many of tools do not apply to the proposed Project.

Therefore, the following farmland protection and preservation measures were considered by the City of Santa Paula and reviewed to determine their feasibility in reducing impacts due to the loss of Important Farmland on the Project Site:

Conservation easements;

Growth management laws;

Right-to-Farm laws;

Subdivision ordinances;

Land evaluation and site assessment; and

The California Land Conservation Act of 1965 (Williamson Act).

Conservation Easements

Conservation easements can protect agricultural land and mitigate impacts to agricultural land. Mitigation via agricultural conservation easements can be implemented by at least two alternative approaches: the outright purchase of easements, or the donation of mitigation fees to a local, regional, or Statewide organization or agency whose purpose includes the acquisition and stewardship of agricultural conservation easements.

In June 2017, local farmers near the Project Site were sent survey letters, as shown in **Appendix B: Agricultural Survey Letter**, to evaluate the feasibility of obtaining agricultural conservation easements. The survey was sent to local landowners regarding the landowners' possible interest in entering into agricultural conservation easements. The five (5) landowners, representing approximately 310 acres of agricultural land, who returned the survey responded that they would not be interested in providing agricultural conservation easements.

This survey indicates that agricultural landowners are reluctant to place their agricultural land into conservation easements due to (1) the ever-changing economic conditions in the agricultural business, and (2) the limitations on the parcel of land's only being permitted to one type of business (agricultural business) for perpetuity. The placement of a permanent development restriction on agricultural land could cause a future burden to the landowner because continued agricultural production is dependent on

economic and social factors that play a role in where and how long the landowner continues to stay in business. Typically, when agricultural business is not profitable, the landowner ceases agricultural production, and either sells the parcel or uses it for a more viable economic use.

Mitigation measure **AG-1** has been included in the Final EIR to reduce or minimize impacts to farmland. This mitigation measure includes two options for the Applicant, one of which includes securing a conservation easement in perpetuity on land designated as Prime Farmland or Important Farmland within the State of California. The other option in mitigation measure **AG-1** would allow the Applicant to contribute funds to a local, regional or Statewide organization, the purpose of which is to acquire agricultural conservation easements for Prime Farmland and Important Farmland, and that has demonstrated a successful track record in doing so for at least 5 years. While impacts to regional farmland would still be considered significant and unavoidable, a conservation easement would mitigate this impact to the extent feasible, consistent with CEQA.

Growth Management Laws

The City of Santa Paula has a voter-approved urban-growth boundary to manage growth. In addition, the City has participated in establishing agricultural greenbelts on both the east and west sides of the City to further limit growth.

The proposed Specific Plan would include the annexation of land located within the City Urban Restriction Boundaries (CURB), which was voted on in November 2016 and continues through December 31, 2050.⁸ The Project Site is not subject to voter approval for the extension of services or for the proposed minor changes in the existing City General Plan land use designations. Measure L6 is not triggered by the proposed Project.

Right-to-Farm Ordinances

As noted, agricultural uses exist on the west and south sides of the property. To the west side of the property, between the Project Site and the agricultural uses, is the Adams Barranca, which acts as a vegetative screen between the properties.

Within the County of Ventura, agricultural uses are protected from future development that may occur adjacent to them. The Ventura County Board of Supervisors adopted a "Right to Farm Ordinance"⁹

8 Save Open Space and Agricultural Resources, "An Initiative Ordinance Amending Existing Limitations on Urban Development and Extending Those Limitations Until December 31, 2050," <http://www.soarvc.org/wp-content/uploads/2014/09/Santa-Paula-Initiatives.pdf>.

9 Ventura County Board of Supervisors, Ordinance 4151, Protect Commercial Agriculture from Nuisance Claims, to Require Notification of such Protection, and to Provide for Mediation of Disputes (adopted October 7, 1997), http://vcportal.ventura.org/AgComm/docs/Right_to_Farm_Ordinance.pdf.

intended to protect the farming community from developments that would inhibit its ability to continue agricultural production. Such things as agricultural wind machines, odors, dust, and noise are often the subject of nuisance complaints by adjoining property owners.

These laws do not particularly seek to save agricultural lands; however, the laws' intent is to provide a cohesive existence between agricultural operations and urban development. The Right to Farm Ordinance protects agricultural operations by limiting the circumstances under which a properly conducted agricultural operation may be considered a nuisance.

The proposed Project would not develop residential uses; therefore, the Right to Farm Ordinance would not apply. The Agricultural Policy Advisory Committee (APAC) Ag/Urban Buffer Policy states that where applicable, urban developments or nonagricultural uses shall be conditioned to provide and maintain a 300-foot setback and chain-link fence on the nonagricultural property between the urban use and the agriculture, or a 150-foot buffer/setback if a vegetative screen is used.

The proposed Project would incorporate an additional 100-foot buffer from the Adams Barranca, creating, at minimum, a 150-foot buffer between the agricultural uses and the proposed Project. To the south of the Project Site, between the agricultural uses, is Faulkner Road, followed by SR 126, which helps to create an approximately 200-foot buffer between the two uses.

Subdivision Ordinances

In the context of farmland protection, subdivision ordinances can require review of potential impacts on agricultural resources; establish design standards, including setbacks and buffers and clustering of new houses; and authorize local officials to suggest alternatives or mitigation measures, or to deny projects based on the impact to agriculture. The Project does not include residential units; therefore, clustering houses would not apply.

The review of potential impacts on agricultural resources and the establishment of design standards, including setbacks and buffers, was completed through the environmental review process the City conducted for this proposed Project and incorporated into the proposed Specific Plan.

Land Evaluation and Site Assessment

California's LESA model evaluates agricultural characteristics of specific sites, as indicated in the CEQA Guidelines. Impacts on agricultural resources may be both quantified and qualified by the use of established thresholds of significance. The LESA model was developed to provide lead agencies with an optional methodology to ensure that potentially significant effects on the environment caused by

agricultural land conversions are quantitatively and consistently considered in the environmental review process.¹⁰

The LESA model is specifically used for evaluating farmland designations. The farmland designations on the Project Site are not under question or consideration for reclassification; therefore, the LESA model was not used by the City to determine the relative value of the agricultural value of the Project Site.

The California Land Conservation Act of 1965 (Williamson Act)

The California Land Conservation Act of 1965—commonly referred to as the Williamson Act—enables local governments to enter into contracts with private landowners for the purpose of restricting specific parcels of land to agricultural or related open space use. In return, landowners receive property tax assessments that are much lower than normal because they are based on farming and open space uses, as opposed to full market value.

Although less restrictive than an easement, a Williamson Act contract would result in similar issues with respect to compatibility and mandating a particular business, whether profitable or not. A Williamson Act contract would establish a commitment to retain farmland for agricultural use. The length of time that this land would remain in agricultural use would be dependent on the terms of the conservation easement or Williamson Act contract, as well as on the economic feasibility of continued agricultural operations. However, a Williamson Act contract would only reduce the potential that the land would be converted to nonagricultural use. The individual and cumulative loss of agricultural land caused by the proposed Project would still occur, however, resulting in a net loss of Important Farmland that could not be recovered.

No properties within the Project Site are subject to active Williamson Act contracts.

Summary

As discussed above, a number of mitigation measures (or farmland protection tools) were considered by the City to determine if any could feasibly reduce impacts associated with the conversion of the agricultural land. While a variety of mitigation measures have been identified by the DOC and other parties, the majority are not applicable or available within the City of Santa Paula.

Conservation easements and payments to organizations that acquire agricultural easements were considered by the City to mitigate the impact of converting agricultural land to nonagricultural use and determined to be a potentially feasible mitigation measure. Mitigation measure **AG-1** defines options for obtaining conservation easements to offset the loss of agricultural land that would occur as a result of the

10 California Department of Conservation, “Land Evaluation & Site Assessment Model (LESA),” accessed July 2015, http://www.conservation.ca.gov/dlrp/Pages/qh_lesa.aspx.

Project. While impacts to agricultural resources would still be considered significant and unavoidable, a conservation easement would reduce this impact.

General Plan Objectives, Goals and Policies Regarding Agricultural Land

In addition to farmland protection tools, the City’s General Plan includes a Conservation and Open Space Element that contains objectives, goals, and policies regarding the protection of agricultural land. These address the conversion of farmland. The proposed Project would comply with the applicable General Plan policies.

The Conservation and Open Space Element¹¹ notes that agriculture has historically been important to the economy of Santa Paula, and this importance continues today. As the area urbanizes, commercial agriculture is very slowly being replaced by other land uses. The presence of prime agricultural soils in the planning area is a natural resource that must be conserved to provide opportunities for ongoing and expanded agricultural operations.

The following goals, objectives, and policies are applicable to agricultural lands within the City and may be applicable to the Project as noted.

Agriculture and Soils

Goals

Goal 3.1 Preserve and protect viable agricultural lands and operations within the City and the expansion areas.

Analysis: The Specific Plan is located within the City of Santa Paula’s SOI and is proposed for expansion with the General Plan, for industrial land uses. Approval and implementation of the Specific Plan would implement the General Plan. Man-made and natural buffers and setbacks would be incorporated between the agricultural uses to the west and south of the Project Site to further protect surround agricultural lands.

The Land Use Element designates the areas west of Peck Road and north of Telegraph Road, and north of South Mountain Road (Lemon Road) within the South Mountain Planning Area for agricultural use. These lands are intended for crops, limited livestock production, limited agriculture, incidental and supportive agricultural uses, structures, and storage on parcels of no less than 20 acres in size.

11 City of Santa Paula, *General Plan*, “Conservation and Open Space Element,” p. CO-45.

Goal 3.2 Development should be compatible with and have minimal adverse impacts upon agriculture and natural resources and should not be wasteful of scarce land.

Analysis: The Specific Plan development would not allow any uses that would be incompatible with adjacent uses. Additionally, man-made and natural buffers and setbacks would be incorporated between the agricultural uses to the west and south of the Project Site to have minimal impacts on existing agriculture and natural resources. This buffer area would also help to preserve the existing Adams Barranca.

Goal 3.3 Urban expansion should be directed away from the most productive agricultural areas.

Analysis: The Specific Plan is within the City of Santa Paula's West Area 2 expansion area. Buffers and setbacks would be established so that urban sprawl into the agricultural lands to the west would be less likely to occur.

Objectives

Objective 3(a) Encourage low-intensity land uses and/or barriers near agricultural lands.

Analysis: Agricultural land exists to the west and south of the Project Site. To the west side of the property, between the Project Site and the agricultural uses, is the Adams Barranca, which acts as a vegetative screen between the properties.

The proposed Project would incorporate an additional 100-foot buffer from the Adams Barranca, thus creating, at minimum, a 150-foot buffer between the agricultural uses and the proposed Project. To the south of the Project Site, between the agricultural uses, is Faulkner Road, followed by SR 126, which helps create an approximately 200-foot buffer between the two uses.

Objective 3(b) Encourage the use of land for agricultural operations.

Objective 3(c) Include areas for agriculture in the City's land use plan.

Analysis: The City of Santa Paula's General Plan Land Use map designates land for agricultural use in the City's Planning Area. Additionally, the City has created large agricultural Greenbelts west and east of the City which protect open space and agricultural lands and reassures property owners located within these areas that lands will not be prematurely converted to agriculturally incompatible uses. Also, the City has established City Urban Restriction Boundary (CURB) areas that require a vote from Save Open Space and Agricultural Resources (SOAR) before allowing urban development beyond the restriction areas.

Policies

Policy 3.a.a Preserve viable agriculture and prime agricultural lands as a greenbelt and buffer around the City.

Analysis: Greenbelts are voluntary agreements between the Ventura County Board of Supervisors and one or more City Councils regarding development of agricultural and/or open space areas beyond city limits. Greenbelts protect open space and agricultural lands and serve to reassure property owners located within these areas that lands will not be prematurely converted to agriculturally incompatible uses.

Cities commit to not annex any property within a greenbelt, while the Board agrees to restrict development to uses consistent with existing zoning. City- and Ventura County–elected officials were pioneers in designing and adopting greenbelts. The first greenbelt, between the cities of Ventura and Santa Paula, was adopted by the County in 1967. A total of seven greenbelts now exist in the County. These are:¹²

- Ventura–Santa Paula Greenbelt
Approximately 27,884 acres of unincorporated County territory between the cities of Ventura and Santa Paula.
- Santa Paula–Fillmore Greenbelt
Approximately 32,000 acres of unincorporated County territory between the cities of Fillmore and Santa Paula

Other Greenbelts:

- Camarillo-Oxnard Greenbelt
- Santa Rosa Valley Greenbelt
- Tierra Rejada Greenbelt
- Ventura-Oxnard Greenbelt
- Fillmore-Piru Greenbelt

The Ventura–Santa Paula Greenbelt is the nearest greenbelt to the southern portion of the City. The proposed Project is not located within any established greenbelt.

Policy 3.b.b Erosion of soils should be controlled and prevented during agricultural use, during storms and especially during the construction phase of new development.

Analysis: As stated in Section 4.6: Geology and Soils of the Draft EIR (see page 4.6-25), construction activities for the proposed Project would comply

12 County of Ventura, Resource Management Agency, “Greenbelt Program,” accessed September 25, 2018, <https://vcrma.org/greenbelt-program>.

with erosion control requirements, including grading and dust control measures, imposed by the City pursuant to grading permit regulations. Each construction project permitted under the Specific Plan would be required to obtain and comply with the City's necessary permits, plans, plan checks, and inspections to reduce the effects of sedimentation and erosion.

Additionally, the Project would be required to have a Storm Water Pollution Prevention Plan (SWPPP) pursuant to the National Pollutant Discharge Elimination System (NPDES) permit requirements. As part of the SWPPP, best management practices (BMPs) would be implemented during construction to reduce soil erosion and pollutant levels to the maximum extent possible.

After construction, the Project may result in a limited degree of soil erosion affects from vegetated areas. However, in accordance with NPDES requirements, the Project would be required to have a Standard Urban Stormwater Mitigation Plan—which would include BMPs that would reduce on-site erosion from vegetated areas and basins on the Project Site—in place during the operational life of each development within the Specific Plan.

Policy 3.c.c

Develop a transfer of development rights program that provides for easements for the preservation of agricultural land areas within the City's Area of Interest.

Analysis:

As discussed above, **MM AG-1** includes two options for the Applicant, one of which includes securing a conservation easement in perpetuity on land designated as Prime Farmland or Important Farmland within the State of California. The other option in **MM AG-1** would allow the Applicant to contribute funds to a local, regional or statewide organization whose purpose is to acquire agricultural conservation easements for Prime Farmland and Important Farmland and has demonstrated a successful track record in doing so, over at least 5 years.

Response 10-9:

The Draft EIR Agricultural Resources section has been updated to include mitigation measure **AG-1**, which was also updated in the Executive Summary.

Response 10-10:

Responses have been provided to the Ventura County Watershed Protection District. Potential flooding impacts have been adequately assessed, and the Project has been designed in a manner that will avoid flooding impacts on and off the site. See responses to comments for Letter No. 6.

Response 10-11:

The City of Santa Paula released its 2016 Draft Urban Wastewater Management Plan (UWMP) for public review on June 30, 2017 and adopted the Final 2016 UWMP on September 5, 2017. As shown in **Appendix D: Final Water Supply Assessment**, the Final EIR and Water Supply Assessment (WSA) have been revised to reflect information from the Final 2016 UWMP.

The Water Supply Reliability section of the Final 2016 UWMP was calculated by the City, and the water supply for a normal year, single dry year, and multiple dry years is shown in **Table 3.0-3: Projected Supply and Demand Comparison for Normal Water Year for 2020–2040**.

Table 3.0-3
Projected Supply and Demand Comparison for Normal Water Year for 2020–2040

Supply vs Demand	2020	2025	2030	2035	2040
Supply Totals	6,908	7,755	8,603	9,450	10,295
Demand Totals	4,608	5,311	6,012	6,714	7,416
Difference	2,300	2,444	2,591	2,736	2,879

Source: City of Santa Paula, Final 2016 UWMP Update (August 2017).

Note: afy = acre-feet per year.

It should be noted that due to conservation efforts, the water supply estimates in the 2016 UWMP are expected to yield more water or other uses than the previous estimates. Additionally, unlike for the 2010 UWMP, the Water Supply Reliability section of the 2016 UWMP indicates that the Santa Paula Water Basin will remain a consistent source of water supply for the City of Santa Paula; therefore, the 2016 UWMP did not adjust supply or demand from an average year to dry years.

Table 3.0-4: Project Supply and Demand Comparison—Average Year (afy), based on the 2016 UWMP, shows the proposed Project water demand as a percent of total supply throughout various milestones in the build-out schedule. By 2027 (build-out), the Project is estimated to demand 39.7 afy of water. Water demand from the Project represents 0.61 percent of the City's total projected urban water demand in 2017, decreasing to 0.41 percent in 2037.

The Water Supply Reliability section of the 2016 UWMP projects total water demands for the Santa Paula Business Park through 2040 and demonstrates that supplies are sufficient to meet demands.

Table 3.0-4
Project Supply and Demand Comparison—Average Year (afy)

	2015	2017	2020	2025	2027	2030	2035	2037	2040

^e City of Santa Paula, Final 2016 UWMP Update (August 2017), 46, Table 3-2 (1,905,750 square feet of development at 15 gal/sq. ft./year is 87.7 afy).

^f See Table 3 in **Appendix D**.

^g See Table 2 in **Appendix D**.

Response 10-12:

The updated project demand is 39.7 afy based on the 2016 UWMP demand factors. The WSA and the Final EIR have been updated to reflect this amount.

Please note that the Domestic Water Technical Report was written for engineering and design purposes—specifically, to determine the size of potable water lines needed to serve the Project and not to provide an estimate of the water that will be used by the proposed uses. The Specific Plan incorporated the water demand estimate from the Domestic Water Technical Report. The engineering factors used to size the water delivery system are different than the water use factors in the City’s UWMP. This is the reason for the difference in the water demand and water use estimates the Draft EIR, Domestic Water Technical Report, and Specific Plan.

Response 10-13:

The proposed Project would cover approximately 43 percent of the 125-acre West Area 2 area (53.81 acres for the proposed Project divided by the 125 total acres for West Area 2).

Fair share for water usage is calculated by calculating the Project’s percent of total area versus the Project’s percent of total water usage. The estimated water demand for the Project were recalculated based on the 2016 UWMP demand factors. The Draft EIR and WSA were updated to reflect these changes. Water usage is estimated at approximately 45 percent because the total water demand estimated for West Area 2 in the City’s 2016 UWMP projected for West Area 2 was 87.7 afy,¹³ and the proposed Project would use 39.7 afy. As noted in the General Plan Land Use Element, a variety of uses are anticipated in West Area 2, including light industrial and research & development uses. Table LU-5, Land Uses and Build-Out for the Expansion and Planning Area, in the Land Use Element (page LU-25) estimates development of approximately 1,905,750 square feet for West Area 2. As proposed, the proposed Project would build out approximately 1,827,777 square feet on 53.81 acres and would occupy approximately 43 percent of the total 125 acres of West Area 2.

Given that the Project area would account for 43 percent of the total area included in West Area 2 area and water usage would account for 45 percent of the total amount of water use projected for West Area 2, the projected water use for the Project is proportional.

The total 87.7 afy allocation for West Area 2 is based on assumptions per the General Plan (see Table LU-5 in the Land Use Element). As applications and subsequent specific plans are developed for the remainder

13 City of Santa Paula, *Final Urban Water Management Plan 2016 Update [Final 2016 UWMP Update]* (August 2017), prepared by Milner-Villa Consulting, 46, Table 3-2 (1,905,750 square feet of development at 15 gal/sq. ft./year is 87.7 afy), <http://www.ci.santa-paula.ca.us/PubWorks/FinalUrbanWaterMgmtPlan.pdf>.

of West Area 2, environmental review may be required at that time. If the future specific plan(s) meet the criteria for a WSA as stipulated under Senate Bill 610, a WSA will need to be prepared. Future project(s) will need to demonstrate that an adequate water supply is available to meet demands at the time any future applications are submitted. Additionally, the City is required to update the UWMP every 5 years and will update the projections for water use in West Area 2 as needed.

Response 10-14:

Please note that the demand for recycled water usage is 17.8 afy. Construction of the new Santa Paula Water Recycling Facility (WRF) was completed in 2010. The City purchased the facility on May 1, 2015. The WRF has a permitted dry-weather capacity of 4.2 mgd and permitted wet-weather (also maximum) capacity of 8.0 mgd. The City WRF produces water that meets California Title 22 regulations for recycled water. At this time, there is no infrastructure built to deliver recycled water within the City.

The 2016 UWMP¹⁴ estimated recycled water urban demand within the City (and adjacent areas) and showed that the recycled water demand could be fully met with recycled water from the new WRF.

The WSA prepared for the Specific Plan determined that the total Project water demand was 39.7 afy. As shown in **Response to Comment 10-11, Table 3.0-4**, the 39.7 afy incorporates the recycled water demand of 17.8 afy if it were to be available as a conservative estimate to prove water demand could continue to be met if recycled water does not become available prior to estimated build-out date. The Project demand and recycled water demand numbers were used to estimate Project supply and demand using the 2016 UWMP data and demonstrate that supplies are sufficient to meet demands. As shown, the projected demand for the Project will account for only 0.49 percent of the total available supply of the supply indicated in the data from the 2016 UWMP at build-out. The City would, therefore, have sufficient water available to meet the needs of the Project if development should occur before recycled water is available at the Project Site.

Response 10-15:

The 50 percent reduction in water use as discussed in the UWMP specifically applies to existing uses within the City that may or may not have water meters installed or do not utilize water-efficient plumbing. All new development will be metered and will incorporate current water conservation features. Therefore, the 50 percent reduction is accounted for with the proposed Project demand estimates.

¹⁴ City of Santa Paula, *Final UWMP 2016 Update*.

The basin is monitored by the United Water Conservation District (UWCD), which has noted the historical fluctuations in the basin. However, based on the fact that primary recharge of the basin results from precipitation both locally and upstream, it is likely that the basin will recover from a gradual decline.

The Santa Paula Basin is an adjudicated basin, and the City has a right to 5,560 afy of water per the adjudication.¹⁵ Any change in allocation within the adjudication amounts would require approval through the court. As an adjudicated basin, the Santa Paula Basin is not subject to the Sustainable Groundwater Management Act (SGMA), which would require the groundwater basin to be managed on a local level by a groundwater sustainability agency. As previously noted, the proposed Project has an estimated water demand of 39.7 afy, of which 17.8 afy could be provided by recycled water when it becomes available. At this point in time, the proposed Project would utilize 39.7 afy of potable water, which would decrease to 22 afy of potable water when recycled water becomes available.

Response 10-16:

As noted in the Project description, as part of the permitting process, a formal application will be submitted to the CPUC for an at-grade crossing of the Ventura County Transportation Commission (VCTC) railroad. Authority to modify an existing public rail crossing is typically granted through the General Order 88-B (GO 88-B), Modification of an Existing Rail Crossing, authorization process, which results in an authorization letter from the Rail Crossings and Engineering Branch supervisor under authority delegated from the VCTC, if General Order 88-B is applicable.

An application will be submitted to CPUC staff in the Rail Crossings and Engineering Branch to request authority to alter a crossing, pursuant to GO 88-B. Such alterations may include roadway widening within the existing right-of-way; approach-grade changes; track-elevation changes; roadway realignment within the existing or contiguous right-of-way; change in the type or addition of an automatic signaling device; the addition of one track within the existing railroad right-of-way; alteration or reconstruction of a grade-separated crossing; or construction of a grade separation that eliminates an existing at-grade crossing.

Response 10-17:

This comment does not address the information or analysis in the Draft EIR. No further response is required.

**SUBJECT: COMMENTS ON SANTA PAULA WEST BUSINESS PARK SPECIFIC PLAN
EIR**

To whom it may concern:

Thank you for the opportunity to comment on the Environmental Impact Report (EIR) for the proposed Santa Paula West Business Park Specific Plan. Please accept and consider these comments on behalf of Golden State Environmental Justice Alliance.

2.0 - Project Description

As we understand it, the proposed Santa Paula West Business Park Specific Plan is composed of 53.81 acres ("Project Site") within the City of Santa Paula's 125-acre West Area 2 designation. The Specific Plan would guide future land use development on approximately 53.81 acres of the City's 125-acre West Area 2 designation. The land use and zoning designations will allow for the

11-1

development of a mixture of light manufacturing, research and development, professional offices, and supporting commercial uses, consistent with the C/LI and LI zones of the City of Santa Paula's Zoning Ordinance.

11-1

3.0 - Related Projects

Table 3.0-1 Related Projects indicates that there are 36 related projects. However, figure 3.0-1 Map of Related Projects does not provide a map of all 36 projects. Specifically, projects number 28, 31, 32, and 33 are not provided on the map. This does not comply with CEQA's requirements for meaningful disclosure.

11-2

4.1 - Aesthetics

Threshold: Substantially degrade the existing visual character or quality of the site and its surroundings?

The EIR concludes that the existing visual character of the site will be significantly and unavoidably impacted. However, there are no suggested mitigation measures for this impact. Possible mitigation measures not addressed include: reducing the massing of the building through a maximum 50% lot coverage instead of 80% lot coverage; reducing the allowable building heights from 35 feet and 45 feet to 25 feet and 35 feet, respectively. The EIR should address these possible mitigation measures regarding SPWBP development standards that could potentially reduce the significant and unavoidable impact to the visual character or quality of life at the site and its surroundings.

11-3

4.2 - Agriculture

Threshold: Convert Prime Farmland, Unique Farmland, or Farmland of Statewide Importance (Farmland), as shown on the maps prepared pursuant to the Farmland Mapping and Monitoring Program of the California Resources Agency, to non-agricultural use?

Threshold: Conflict with existing zoning for agricultural use, or a Williamson Act contract?

The EIR indicates that the project site is comprised of prime farmland and farmland of statewide importance. The project site has a current designation of "A-E Urban Reserve for land currently in agricultural use" under the current Ventura County General Plan. The proposed project would convert the entire site to non-agriculture use. The EIR presents this conflict but focuses heavily on the consistency of the project with the Santa Paula General Plan, which changes the designation to commercial/light industrial. The EIR also states that Santa Paula is not requiring mitigation measures for the loss of prime farmland/farmland of statewide importance. However, the EIR does not provide a reason for this or a CEQA exemption for which mitigation is not required. The EIR should evaluate the possibility of agriculture conservation easements as

11-4

potential mitigation (*Masonite Corp. v. County of Mendocino*, 218 Cal. App. 4th 230 - Cal: Court of Appeal, 1st Appellate Dist., 3rd Div. 2013).

11-4

4.3 - Air Quality

Threshold: Conflict with or obstruct implementation of the applicable air quality plan?

The EIR states, "According to the VCAPCD Guidelines, to be consistent with the AQMP, a project must conform to the local general plan and must not result in or contribute to an exceedance of the City's projected population growth forecast. The proposed Project does not include any new residential uses and would not result in the direct growth of population within the Santa Paula Growth Area." The EIR does not address conformance with the local general plan. The proposed project is not in conformance with the Ventura County General Plan and thus in conflict with the AQMP. Not addressing this aspect of the consistency requirements is not in keeping with CEQA's requirements for meaningful disclosure.

11-5

Threshold: Violate any air quality standard or contribute substantially to an existing or projected air quality violation?

Construction Emissions

The EIR provides information regarding construction including it was modeled for a 10 year time period with overlapping construction phases. The EIR then states that, "In reality, this would not occur, as most equipment operates only a fraction of each workday and many of the activities would not overlap on a daily basis". This statement is misleading and makes the EIR less useful as an informational document. It is possible for construction phases to overlap at some point throughout the 10 year construction period, which may last even longer due to market conditions according to the project description.

11-6

The EIR indicates that construction emissions were modeled for a 10 year duration while the project description indicates that construction may take longer due to market conditions. The EIR should provide additional extended analysis for 12, 15, 17, and 20 year construction year periods in order to fully analyze and disclose the potential air quality impacts. Also, there is no requirement that the project be completed over a certain number of days given. Construction may occur faster as well, which would result in significantly greater daily impacts.

Further, section 93.23(A) of the Santa Paula Municipal Code indicates the legal hours of construction are 8:00 AM - 6:00 PM Monday - Friday. The Air Quality Analysis does not present the "worst-case scenario" of construction equipment emitting pollutants for the legal 10 hours per day. The Air Quality modeling must be revised to account for these legally possible longer construction days.

Threshold: Expose sensitive receptors to substantial pollutant concentrations?

11-7

The EIR states that sensitive receptors were placed “uniformly along the fence line” but does not state which sensitive receptors were analyzed. Was it the residential to the north? Was it the properties nearest the project site or was it a property on the other side of the mobile home park?

11-7

4.3.7 - Residual Impacts after Mitigation

The EIR indicates that air quality impacts related to the project will be significant and unavoidable after mitigation. However, it does not provide any of the mitigated emissions rates in this section. The EIR must provide the mitigated emissions figures in order to fully comply with CEQA’s requirements for meaningful disclosure.

11-8

4.11 - Noise

Threshold: Exposure of persons to or generation of noise levels in excess of standards established in the local general plan or noise ordinance, or applicable standards of other agencies

The EIR states that “Santa Paula Municipal Code (SPMC) Chapter 93 sets noise standards for the City. SPMC Section 93.21 establishes the acceptable *exterior* noise standard for residential uses of 65 dB(A) from 7:00 AM through 10:00 PM, and of 60 dB(A) from 10:00 PM through 7:00 AM. *The SPMC does not set acceptable interior noise level standards*”. This is not an accurate statement. The SPMC does not specify if the noise standards provided are for interior or exterior measurement. However, the SPMC does provide a definition for noise level measurement in which a noise meter “microphone must be a minimum of 3-1/2 feet from any wall, floor or other large sound reflecting surface”. This definition indicates that noise level measurement can be taken from the interior of a property. The EIR should reflect this accurate information.

11-9

The EIR also states that “construction is temporary” even though the proposed construction timeline is 10 years, and possibly longer. This statement should be removed.

11-10

Noise at Surrounding Noise Sensitive Uses

The EIR states that “Although the City considers construction noise temporary and intermittent, future development within the Project Site would be required to comply with SPMC section 93.21, which generally requires construction noise to be restricted to the hours of 8:00 A.M. to 6:00 P.M. Monday through Friday (though a temporary noise permit can be obtained pursuant to SPMC section 93.06). This will reduce noise impacts for both surrounding uses”. The EIR does not provide a definition of construction noise which the City defines construction noise as temporary and intermittent. This is not representative of the proposed project as the construction timeline is a minimum of 10 years. Further, this statement says that “generally” construction noise is limited to 8:00 AM - 6:00 PM Monday through Friday. The term “generally” should be

11-11

deleted as it is misleading - the SPMC explicitly requires these hours to be the legal hours of construction. Finally, the EIR concludes by stating that "This will reduce noise impacts for both surrounding uses" but does not provide any evidence of this. How will limiting construction noise to 10 hours per day reduce noise impacts for both surrounding uses?

11-11

Further, the EIR is inadequate as an informational document in that it does not disclose where the sensitive receptors were placed for analysis. Where, exactly, were they placed? Were the residents on the north boundary of the project site placed the same way as the receptors on the west boundary? Conservative modeling should have assessed what might have happened to the receptors given their exposure at their property lines.

5.0 - Alternatives

The EIR identifies the project objectives in a manner that makes the construction of the project a foregone conclusion. Objectives such as "permitting new investment and development in West Area 2 that reflects and complements the existing pattern and scale of development in Santa Paula; Provide for light industrial and commercial uses that complement existing uses adjacent to the Project area" mean that this Project will be implemented as a certainty.

CEQA requires analysis of a "reasonable range" of alternatives. Here, since the No Project Alternative is required, the EIR analyzes only two. This does not comply with a reasonable range of alternatives. The alternative site selection was rejected because "there are no suitable sites available that could accommodate a large industrial/retail commercial center *of the type that would permitted under the Specific Plan*". Again, this indicates that construction of the project is a foregone conclusion.

11-12

The EIR goes on to discuss other expansion areas in the Santa Paula General Plan (Fagan Canyon and Adams Canyon) but states they they "are not suitable in terms of location and other site characteristics, to accommodate a large light industrial/commercial center". The EIR does not provide any detail regarding the "location and other site characteristics" and why they do not make a suitable alternative site. Further, this statement communicates that there are alternate sites available. This is not in keeping with CEQA Guidelines section 15126.6(f)(1), which allows consideration of whether the applicant "can reasonably acquire, control or otherwise have access to the alternative site," among other considerations.

Conclusion

For the foregoing reasons, GSEJA believes the EIR is flawed and an amended EIR must be prepared for the proposed project and recirculated for public review. Golden State Environmental Justice Alliance requests to be notified via email at goldenstateeja@gmail.com regarding any subsequent environmental documents, public notices, public hearings, and notices of determination for this project.

11-13

Sincerely,

A handwritten signature in black ink, appearing to read 'Joe Bourgeois', with a long, sweeping horizontal stroke extending to the right.

Golden State Environmental Justice Alliance

Letter No. 11

Joe Bourgeois, Chairman of the Board
Golden State Environmental Justice Alliance
Letter dated December 18, 2016

Response 11-1:

This comment does not address the information or analysis in the Draft EIR. No further response is required.

Response 11-2:

Project numbers 28, 31, 32, and 33 do not have specific addresses, as shown in Table 3.0-1: Related Projects, of the Draft EIR. However, approximate locations were added to the related projects map for related project numbers 28, 31, and 32, as shown in **Figure 3.0-3: Related Projects**. Related project number 33 is a Citywide crosstown pipeline and does not have an exact location. It should be noted that while none of these four related projects is near the Project Site, these projects were considered in the cumulative analysis in the Draft EIR.

Additionally, two projects, 37 and 38, were added to the related projects list and map to reflect the newest projects within the City. The cumulative analysis was updated for each issue area based on the addition of these two projects.

Response 11-3:

The proposed Project would alter the existing visual character from agricultural to urban uses, and this change has been identified as a significant and unavoidable impact. Reducing the density of the Project would not avoid or substantially reduce this impact, which results from the conversion of the site from agricultural use.

However, the Draft EIR, as part of the discussion on alternatives (see Section 5.0), does consider and evaluate less-intensive development alternatives. While the alternatives do not specifically address building and lot coverage, they do address both a 25 percent and 50 percent reduction in land development area. Indirectly, these reductions would result in less lot coverage. Conversely, they could result in the same density. The EIR determined that both alternatives would likely result in the same impacts as would the proposed Project. Impacts would be significant and unavoidable.

With regard to other alternatives involving less density, as mentioned in the letter in **Appendix C: Letter Correspondence with Doug Shaw**, Mr. Shaw, who is First Vice President of Commercial Real Estate Services, notes that tenants in the market look for square footage that can range from 10,000 to up to

200,000 square feet—even larger in some cases.¹⁶ Limiting the maximum size of any individual building to 30,000 square feet would drastically limit the ability to lease or sell the properties because the Project would not be able to market to large numbers of potential tenants seeking larger spaces. In addition, limiting the clear height would detract from and limit the market for potential tenants. In today’s market, low clear height buildings do not lease as quickly. For most tenants, such a factor would immediately remove that property from consideration. The current market reflects the “ecommerce era,” with most companies needing a minimum 24-foot height clearance under the beam at the lowest point of the warehouse, with up to 30 feet and even 32 feet clear required to accommodate stacking storage.

16 Letter correspondence with Doug H. Shaw, First Vice President, CBRE, Advisory & Transaction Services, Industrial Properties, dated March 28, 2017.

SOURCE: Google Earth - 2018; Meridian Consultants, LLC - 2018

FIGURE 3.0-3

Location of Related Projects

For example, one of the oldest major businesses in Santa Paula is Calavo, an avocado processing and marketing company. A similar company in the area is Mission Produce in Oxnard, which recently completed construction of a 200,000-square-foot cooler building with an interior clear height of 30 feet. If Calavo or a similar agricultural processing company were interested in building a facility in the Project, and the building height were reduced as suggested, this type of tenant could not be accommodated in the Project.

Economically, it would take significantly longer to locate potential buyers and tenants, putting the proposed Project at a disadvantage versus competing properties in neighboring cities. Given that time is the downfall of many real estate projects, limiting the size of buildings in the Santa Paula West Project could cause the Project severe economic damage. As such, the consideration of lower building heights was eliminated from consideration, to err on the side of a successful project.

Response 11-4:

Annexation of the Project Site to the City of Santa Paula would be subject to approval from LAFCo, which requires consistency with State laws, as well as with relevant LAFCo policies and procedures. Given that the Project Site is currently located within the City's LAFCo approved SOI, implementation of the Project would not conflict with State law or LAFCo's annexation policies and procedures. Government Code 56668, contains factors that LAFCo is required to consider in its decision to approve a boundary reorganization request.

The Project proposes the construction of urbanized uses within an expansion area that is currently within the CURB. Therefore, no voter approval is required to amend the CURB. Because the proposed project will be annexed into the City of Santa Paula, withdrawal from the County General Plan does not need to be addressed. With respect to the Project's consistency with LAFCo policy (see **Response to Comment 10-7**), the applicable LAFCo policies have been addressed.

Additionally, mitigation measure **AG-1** was incorporated into the Draft EIR, which will require the Applicant to provide mitigation to the extent feasible utilizing conservation easements and/or payments to an organization which acquires agricultural conservation easements, to minimize or reduce the level of impacts to farmland.

Response 11-5:

As discussed in Section 4.10: Land Use of the EIR, the Specific Plan area would be annexed into the City of Santa Paula and removed from the County of Ventura Agricultural and Urban Reserve designations. With LAFCo's approval of the reorganization, the Project Site would no longer be subject to the County of

Ventura’s land use and zoning controls. Therefore, if approved by LAFCo and upon annexation, the Project would not conflict with the County of Ventura General Plan and Non-Coastal Zoning Ordinance.

The Specific Plan is proposed for adoption as an amendment to the City of Santa Paula’s General Plan. Upon adoption by the City, the Project would retain City General Plan Land Use Element designations and City zone district classifications to the affected properties, replacing the existing County of Ventura land use and zoning designations. The proposed City land use designations and zone district classifications match the designations for the Project Site, as shown on the City’s General Plan Land Use Map. Therefore, the Specific Plan would be consistent with the City’s General Plan and would not result in any conflicts.

The 2007 Air Quality Management Plan (AQMP), as discussed in Section 4.3: Air Quality, of the Draft EIR, was prepared to accommodate growth, reduce the high levels of pollutants within the County of Ventura, return clean air to the region, and minimize the impact on the economy. Projects that are considered consistent with the AQMP would not interfere with attainment because they were included in the projections utilized in the formulation of the AQMP. Therefore, the Project uses and activities that are consistent with the applicable assumptions used in the development of the AQMP would not jeopardize attainment of the air quality levels identified in the AQMP.

The City has a population of 30,654 as of January 1, 2017, based on the California Department of Finance estimate.¹⁷ The General Plan projects a population of approximately 37,920 (see Table 2-7 of the Land Use Element) for the City. The Ventura County Air Pollution Control District (VCAPCD) AQMP is based on regional population forecasts developed by the Southern California Association of Governments (SCAG). SCAG’s most recent population forecast was adopted in 2016 as part of the *2016–2040 Regional Transportation Plan/Sustainable Communities Strategy*. The 2016 SCAG growth forecast for Santa Paula projects a population increase from 29,800 in 2012 to 38,800 by year 2040, and an employment increase from 7,800 jobs in 2012 to 11,700 jobs by the year 2040.¹⁸ The proposed Project would not increase the amount of housing within the Specific Plan area because no residences would be built.

As of 2012, the City of Santa Paula’s employment number was 8,247.¹⁹ The Project would result in employment of approximately 1,510 employees,²⁰ or approximately 12.9 percent of SCAG’s projected employment growth by the year 2040 of 11,700 employees for the City of Santa Paula. For analysis

17 California Department of Finance, “Table E-1, Population Estimates for Cities, Counties, and the State—January 1, 2016 and 2017,” <http://www.dof.ca.gov/Forecasting/Demographics/Estimates/E-1/>, accessed June 19, 2017.

18 Southern California Association of Governments, *Final 2016–2040 Regional Transportation Plan/Sustainable Communities Strategy* (April 2016), <http://scagrtpsc.net/Documents/2016/final/f2016RTPSCS.pdf>.

19 City of Santa Paula, Santa Paula Demographics and Statistics, “Profile of the City of Santa Paula: 2012 Statistical Summary,” <http://www.ci.santa-paula.ca.us/DemoStat.htm>

20 US Green Building Council, “Building Area Per Employee by Business Type” (May 13, 2008), accessed August 24, 2016, <http://www.usgbc.org/Docs/Archive/General/Docs4111.pdf>.

purposes, this growth in employment would only increase population in Santa Paula if all 1,510 employees relocated to the City of Santa Paula; these future employees would account for 17 percent of the projected growth in population for the City. This is considered a conservative estimate because employees may already live in the City or may reside in other nearby cities. Given that employment opportunities within the City are estimated to steadily increase through the years from the current estimated population of 30,654 to SCAG's estimate of 38,800 by 2040, the Project's addition of 1,510 employees would be consistent with the SCAG's projections.

The planned uses would also be consistent with the City's land use and zoning designation for the Project Site. The Project would accommodate a mix of commercial and light industrial uses within walking distance, which would reduce the need for residents within the City to travel long distances to other commercial and entertainment centers. As such, the Project would not conflict with the 2016 AQMP and, as such, would not jeopardize attainment of State and national ambient air quality standards in the County of Ventura.

Further, the City's General Plan Conservation Element includes Policy 4.b.b., which states: "Review individual development projects to ensure that air quality control measures are incorporated to the greatest extent possible." The Conservation Element also provides Implementation Measure 21b, which states:

Encourage the implementation of programs and strategies which reduce air emissions. For example, emission reduction measures may include:

- *Provision of on-site employee services and preferential parking for carpools*
- *Parking lot design to reduce vehicle cueing*
- *Provision of transit services and pedestrian/bicycle access*
- *Transportation Demand Measures (TDM)*
- *Energy efficient building materials and lighting*
- *Ozone precursor control measures*
- *Dust control measures*

Implementation of mitigation measures in the EIR are consistent with the City's policies. Specifically, mitigation measures **AQ-1** through **AQ-5**, would reduce construction emissions and would be consistent with VCAPCD Rule 50 (Opacity), Rule 51 (Nuisance), and Rule 74.2 (Architectural Coating). In addition, mitigation measures **AQ-6** through **AQ-8**, **AQ-12**, and **AQ-13** would reduce operational emissions to the greatest extent feasible.

Response 11-6:

Initial land development including, site clearing, grading, roadway construction, and improvements of the Project Site which constitute by far the greatest amount of construction related emissions, are anticipated to occur over approximately a 4-month period starting in sometime in 2019. For purposes of the analysis within this EIR, construction of individual buildings is assumed to occur over approximately 10 years in response to market conditions.

According to the Ventura County Air Quality Assessment Guidelines, construction-related emissions of ROG and NOx are not counted toward two significance thresholds because these emissions are temporary. However, construction-related emissions should be mitigated if estimates exceed the 25-pound-per-day threshold. As shown in Tables 4.3-6, Construction Emissions, Table 4.3-7, Worst-Case Construction Emissions (2020), and Table 4.3-8, Operational Emissions, in the Draft EIR, emissions would exceed the thresholds for ROG and NOx. Implementation of mitigation measures **AQ-1** through **AQ-5** would reduce construction emissions and would be consistent with VCAPCD Rule 50 (Opacity), Rule 51 (Nuisance), and Rule 74.2 (Architectural Coating).

Furthermore, implementation of mitigation measures **AQ-6** through **AQ-13** would reduce operational emissions, including emissions from area and mobile sources. It was concluded that with implementation of mitigation measures, impacts from emissions of ROG and NOx for both construction and operation would still exceed the regional emission thresholds. Impacts would remain significant and unavoidable.

Response 11-7:

As stated on page 4.3-23 of the Draft EIR, off-site receptors were uniformly placed along the fence line and at 10- and 50-meter buffers to provide a comprehensive evaluation of the fate and transport of dust and particulate matter toward sensitive receptor locations. As such, fence-line (Project boundary) emissions or sensitive receptors are the points of maximum impact, which is in accordance of the Office of Environmental Health Hazard Assessment guidelines. As shown in Tables 4.3-10, Diesel Particulate Carcinogenic Risk, and 4.3-11, Diesel Particulate Noncarcinogenic Risk, in the Draft EIR, carcinogenic and noncarcinogenic risks at the fence line would not generate any significant air quality impacts with regard to temporary exposure to emissions of toxic air contaminants that would occur during construction.

Response 11-8:

As shown in Table 4.3-6 of the Draft EIR, construction unmitigated and mitigated emissions are presented. Furthermore, Table 4.3-8 presents the maximum mitigated operational emissions. Based on the data provided, it was concluded that air quality impacts during construction and operation would be significant and unavoidable even with mitigation.

Response 11-9:

The Santa Paula Municipal Code (SPMC) sets forth the maximum exterior noise levels for specific land uses that cannot be exceeded at receiving land uses unless specially exempted by the SPMC or permitted by the City. For industrial zones, the exterior noise level standard is 75 dB(A). For commercial and office uses, the exterior noise standard is 70 dB(A). The municipal code does not define interior noise standards for industrial buildings, nor should any be implied as suggest by the comment.

Commercial, industrial, and warehousing land uses such as the proposed Project and adjacent industrial uses need only conform to applicable State and federal workplace safety standards for interior noise levels, as stated in Cal/OSHA Title 8 regulations.

Response 11-10:

Construction equipment operates at its noisiest levels for certain percentages of time during operation. Equipment such as excavators, graders, and loaders would operate at different percentages over the course of an hour. As such, noise level increases would be temporary and intermittent, and would predominately occur during the initial site preparation phase sometime in 2019.

Response 11-11:

Construction equipment operates at its noisiest levels for certain percentages of time during operation. Equipment such as excavators, graders, and loaders would operate at different percentages over the course of an hour. As stated in page 4.11-28 of the Draft EIR, sensitive land uses surrounding the Project Site, such as the residential units to the north, may experience construction noise in excess of 3 dB(A) over existing ambient noise conditions. However, construction activities on Monday through Friday between 8:00 AM and 6:00 PM are not subject to the noise level standards established by the City's Noise Ordinance (SPMC Section 93.23), although a temporary noise permit can be obtained for construction activities outside of these time periods (SPMC section 93.06). The City's Noise Element requires that construction activities employ feasible and practical techniques to minimize the noise impacts on adjacent uses. Implementation of mitigation measure **N-2** would require construction equipment to be equipped with appropriate mufflers in good working condition. Standard exhaust mufflers for all equipment and the break in line of sight to a sensitive use would reduce construction noise levels by approximately 7 dB(A). Further, as previously mentioned, initial land development including, site clearing, grading, roadway construction, and improvements of the Project Site are anticipated to occur over an approximately 4-month period starting sometime in . For purposes of the analysis within this EIR, construction of individual buildings is assumed to occur over approximately 10 years in response to market conditions. As such, construction noise impacts would occur on a temporary basis and be less than significant.

Response 11-12:

The State CEQA Guidelines Section 15126.6(a) state that:

An EIR shall describe a range of reasonable alternatives to the project, or to the location of the project, which would feasibly attain most of the basic objectives of the project but would avoid or substantially lessen any of the significant effects of the project, and evaluate the comparative merits of the alternatives. An EIR need not consider every conceivable alternative to a project. Rather it must consider a reasonable range of potentially feasible alternatives that will foster informed decision making and public participation.

A suitable site for this proposed Project would need to be approximately 54 acres in size, zoned for industrial or commercial uses, and preferably not abut residential uses. The City completed an inventory of vacant land within the City limits for the City's 2013-2021 Housing Element Update. This inventory identified approximately 60 acres of vacant, residentially zoned land, including several small vacant commercial properties, within the current City limits. Those vacant sites are not contiguous, are dispersed throughout the City, and are not suitable for development with the type of light industrial and business park uses that would be accommodated by this proposed Project, nor are they located at the western gateway to the City, nearest the City of Ventura and its high population, and the coast, which are all important to the City and the Project's attraction to buyers and/or renters.

The Draft EIR considers three alternatives: the No Project Alternative and two alternatives with less development (25 percent and 50 percent). As noted in Section 15126.6(a) above, an EIR does not need to include every conceivable alternative, only a reasonable range. The State CEQA Guidelines further state that "[t]here is no ironclad rule governing the nature or scope of the alternatives to be discussed other than the rule of reason."

The purpose of the alternatives as stated in the CEQA Guidelines Section 15126.6(b) is to

identify ways to mitigate or avoid the significant effects that a project may have on the environment (Public Resources Code Section 21002.1), the discussion of alternatives shall focus on alternatives to the project or its location which are capable of avoiding or substantially lessening any significant effects of the project, even if these alternatives would impede to some degree the attainment of the project objectives, or would be more costly.

Because the Draft EIR has identified multiple alternatives, it complies with the CEQA Guidelines. Further, the comment does not suggest any other alternatives for consideration other than to state the EIR "concludes that development is a foregone conclusion."

The City of Santa Paula, as discussed in the General Plan Land Use Element, identified several expansion areas within the City's SOI to accommodate growth and considered three land use scenarios. A preferred growth scenario was selected by the City Council that scenario forms the basis of the General Plan. That scenario has been modified as a result of a citizens' initiative known as the Save Open-Space and Agricultural Resources (SOAR) Santa Paula City Urban Restriction Boundary Initiative, as subsequently amended by the voters. The Land Use Element of the General Plan carries out the preferred scenario by calling for expansion outside the existing City limits and recommending several land use and policy changes for land within the City limits.

Four expansion areas and one planning area are identified in the General Plan. The expansion areas are Adams Canyon, Fagan Canyon, East Area 2, and West Area 2; and the planning area is South Mountain. The Land Use Element of the General Plan (see page LU-21) notes that Specific Plans are required for all expansion areas within the city.

Table LU-5 in the General Plan illustrates the land uses types, amounts, and build-out planned for the expansion scenario. As noted therein, the General Plan consider both Adams Canyon and Fagan Canyon for primarily residential development with little or no industrial area (Adams Canyon, 495 units; and Fagan Canyon, 450 units), which relate to several factors including their mountain topography, relatively more remote location, and distance from utility infrastructure. As such, the City, not the EIR, has identified the areas for development; the alternatives presented in the EIR are consistent with the General Plan.

Response 11-13:

As demonstrated by the responses to the comments in the Final EIR, the Draft EIR contains factual, objective, and accurate information regarding potential on- and off-site environmental impacts; identifies regulatory requirements and feasible mitigation measures; and provides analysis of alternatives that supports the conclusions presented on the significance of the impacts of the Project, consistent with the requirement of CEQA. Revisions to the Draft EIR as necessary have been made and are listed in **Section 4.0, Revisions to the Draft EIR**, of this Final EIR.

Subject: Santa Paula West Business Park

Ms. Minsk,

Please advise on when this project is scheduled to go before the City Planning Commission.

Also, please add my email address to this projects notification list.

Thank You,

Joe Bourgeois

Subject: Re: Cultural Resources section of DEIR

hello, the sensitivity map should not be for public viewing. I don't know if you are only showing me. If not please remove it from public view. People use things like this to dig up artifacts to sell. I had personal conversation with a County planning staff person and She said the Sensitivity map is out dated. Many of the older buildings are often built on raised foundations, which means that there was little ground disturbance. If there are Cultural Resources underneath those buildings, there can be intact sites. Monitoring should occur when building are demolished. Disking actually doesn't do a lot of soil disturbance, there can be CR material or even Burials subsurface. Our cemetarys are not always a lot of people, it can only be one, sometimes fragments. I would like to see a full Phase 1 survey done with trenching to locate the sensitive areas. I find the idea of having "a contractor must cease work" ineffective, they are not a qualified Archaeologist. The Archaeologist should be one who has worked and is familiar with California (Ventura Co. area) Native Culture and traditions. There should also be a qualified Native (Chumash) Monitor present. This individual should be able to demonstrate their lineage and be a member of a State recognized Tribe as on the NAHC SB-18 and AB-52 list These two professionals should continue to monitor throughout all earth disturbing activities as well as landscaping projects that are going to be in undisturbed soil. There will no need to watch recompacted soils that had been previously monitored. Any Human Remains that are unearthed , I would like to see an attempt to leave them in place . If this is unavoidable then reburial in an area on property. Although this is only my personal view. The MLD will make a recommendation. Thank-you for your call today. If there is a chance to see the property(site visit)that would be helpful. I may have more, can't anymore. Thank-you, Julie

Letter No. 13

Julie Tumamait-Stenslie

Email dated December 13, 2016

California Senate Bill (SB) 18²¹ requires cities and counties to notify and consult with California Native American Tribes about proposed local land use planning decisions in order to protect Traditional Tribal Cultural Places.²² Cities and counties must obtain a list of the California Native American tribes from the Native American Heritage Commission (NAHC), whose traditional lands within the agency's jurisdiction may be affected by a proposed adoption or amendment of a general plan or specific plan. Before the adoption or any amendment of a general or specific plan, a local government must notify the appropriate tribes of the opportunity to conduct consultations on the proposed project. Before the adoption or substantial amendment of the general plan or specific plan, a local government must refer the proposed project to those tribes on the Native American contact list that have traditional lands within the agency's jurisdiction.

As part of the process of identifying Native American cultural resources within or near the project area and to meet the requirement of Senate Bill 18, the City prepared and mailed letters to a contact list of four (4) Native American individuals, provided by the NAHC, that may have knowledge of cultural resources in or near the project area. The list of Native American individuals and letter sent out are contained with **Appendix E** of this Final EIR. The City requested information regarding any Native American cultural resources within or immediately adjacent to the project area. The only Native American group that contacted the City was via email was the Barebarena/Ventureno Band of Mission Indians. The email comments provide by Barebarena/Ventureno Band of Mission Indians are contained with the Final EIR and responded to below.

Response 13-1:

The Archaeological Sensitivity Map, Ventura County (South Half) (Figure 3.5-1 in the Draft EIR) is public information. The map is from the Ventura County General Plan, Resources Appendix, Figure 1.8-1, and is available to the public online at <http://vcrma.org/pdf/plans/General-Plan-Resources-Appendix-6-28-11.pdf>. As shown in the Draft EIR, the figure does not show locations beyond what is currently available via the County to the public.

21 California Government Code, sec. 65040.2, 65092, 65351, 65352, and 65560; California Civil Code, sec. 815.3.

22 California Senate Bill 18, ch. 905, Statutes of 2004.

Response 13-2:

As noted in the Draft EIR, Section 4.5, Cultural Resources, a Phase I archaeological survey was completed by ASM Affiliates and is documented in the report *Phase I Archaeological Survey of the Santa Paula West Specific Plan Area, Santa Paula, Ventura County, California*, dated June 2, 2015. The report is included in Appendix 4.5 of the Draft EIR.

Response 13-3:

The Draft EIR includes mitigation measure **CUL-2**, which addresses human remains that may be discovered during grading and excavation activities. Mitigation measure **CUL-2** provides procedures and protocols to be followed in the event of such a discovery, which are consistent with best practices in the sensitive treatment of any such remains.

4.0 REVISIONS TO THE DRAFT EIR

In accordance with State CEQA Guidelines Section 15132, this section presents the changes that were made to the Draft EIR to clarify or amplify the text in response to comments. Such changes are insignificant as the term is used in State CEQA Guidelines Section 15088.5(b).

Changes to the Draft EIR use ~~strike-out~~ for text that is removed from the Draft EIR and double underline for text that is added to the Draft EIR. Each change is preceded by a brief explanation of the reason for the change.

Section ES, Executive Summary

Page

Revision:

ES-1

Project Location

The 53.81-acre Project Site is ~~area~~ near the western boundary of the City of Santa Paula and currently lies within the unincorporated County of Ventura. The Project Site is bound to the north by Telegraph Road; to the south by SR 126; to the east by existing industrial and commercial development in the current City limits; and to the west by the Adams Barranca and agricultural operations. The Project Site is bisected by the Ventura County Transportation Commission (VCTC) railroad right-of-way. Local access is provided by Telegraph Road, Beckwith Road, Clow Road, and Todd Lane.

ES-6-7

Table ES-2, Summary of Project Impacts, Aesthetics

<p>Construction activities within the Project Site and off-site improvements, such as along Beckwith Road and Faulkner Road, could potentially be visible from SR 126 and Telegraph Road and other vantage points that currently have views of these areas. Additionally, <u>initial land development including, site clearing, grading, roadway construction, and improvements of the Project Site are anticipated to occur over approximately a 4-month period starting in sometime in 2019. For purposes of the analysis within this EIR, construction of individual buildings is assumed to occur over approximately 10 years in response to market conditions</u> the construction timeframe would occur over approximately 10 years and would alter the existing open space character of the Project Site from immediate surroundings.</p>	Potentially Significant	The impact is on a temporary basis and there are no mitigation measures.	Potentially Significant and Unavoidable (on a temporary basis)
<p>The Project would provide for the development of commercial and light industrial uses, along with roadways and open space across the 53.81-acre Project Site. Building heights would be consistent with the 1- to 2-story buildings having similar uses to the east of the Project Site, with a maximum building height of 35 feet and 45 feet for commercial/light industrial and industrial uses, respectively. Views of the agricultural fields from the SR 126 would be replaced with views of commercial and industrial uses related to the Project. Scenic aspects of the Project Site of the Project Site also include the agricultural lands and Adams Barranca west of the Site. While implementation of the Project</p>	Less than Significant	No mitigation measures required.	Less than Significant

<p>would result in the loss of views of the existing agricultural lands in the immediate foreground with the addition of structures, circulation system, and supporting infrastructure, the urbanized appearance is similar to the adjacent uses, and in More distant scenic vistas views of the Santa Clara River Valley would not be significantly altered upon the development of structures on the Project Site. Therefore, the Project would result in less than significant adverse impacts to scenic vistas.</p>			
---	--	--	--

ES-7 Table ES-2, Summary of Project Impacts, Aesthetics

<p>The Project would incorporate various open space/passive uses into the Project design to preserve the visual quality of Adams Barranca, would not remove visually important trees or geologic features, and since the segment of SR 126 that is adjacent to the Project Site is not eligible for designation <u>as a scenic highway</u>, implementation of the Project would not damage scenic resources within a designated state scenic highway.</p>	<p>Less than Significant</p>	<p>No mitigation measures required.</p>	<p>Less than Significant</p>
---	------------------------------	---	------------------------------

ES-8 Table ES-2, Summary of Project Impacts, Aesthetics

<p>The existing visual character and quality of the Project Site is predominantly agricultural in nature, with ancillary agricultural facilities, row crops, and orchards. Due to the Project Site's relatively low and flat elevations, many off-site vantage points of the Project Site are obstructed by existing structures and buildings. However, development within the</p>	<p>Potentially Significant</p>	<p>No mitigation measures.</p>	<p>Significant and Unavoidable</p>
--	--------------------------------	--------------------------------	------------------------------------

<p>Project Site can be seen from vantage points that are located immediately adjacent to the Project Site, such as those along SR 126, Telegraph Road, Beckwith Road, Todd Lane, and Faulkner Road. Furthermore, while elevations of the Project Site would remain relatively flat and at low elevations, and although the Specific Plan development standards will be required to ensure a consistent and compatible aesthetic character with the developments to the east, the existing open space and agricultural character of the Project Site would substantially change. The altered views from the public viewpoints that immediately surround the Project Site are considered significant and unavoidable.</p>			
---	--	--	--

ES-8 Table ES-2, Summary of Project Impacts, Aesthetics

<p><u>The Project’s development standards establish the types of materials that can be used for various types of structures on the Project Site; reflective, glare-producing materials are prohibited. Daytime sources of glare would include the sun reflecting off glass windows of structures and vehicles. Glare produced from these sources would be brief and intermittent. Therefore, impacts related to glare would be less than significant.</u></p> <p><u>The Project’s nighttime sources of light would include outdoor lights, such as mounted lights and lighted signs on the buildings, parking lot lighting, interior building lights, and headlights of vehicles.</u></p>	<p>Potentially Significant</p>	<p>AES-1: Before the City issues grading permits, the applicant must prepare and submit a Lighting Plan to the City of Santa Paula Planning Director for approval that identifies the types of shielding that will be used for outside lighting <u>and must comply with all applicable dark sky ordinances/regulations.</u></p> <p>All exterior night lighting installed on the Project Site shall be of low-intensity, low-glare design, and hooded to direct light directly downward onto the area being lighted to prevent spillover onto adjacent parcels. Shielding must be included to eliminate uplighting. Exterior lighting fixtures must be kept to the minimum number and intensity needed to ensure public safety. These lights shall be dimmed after 10:00 PM to the maximum extent practical without compromising safety. Upward directed exterior lighting is prohibited.</p>	<p>Less than Significant</p>
---	--------------------------------	---	------------------------------

<p><u>Given that minimal outdoor lighting is currently emitted from the Project Site, these impacts related to the additional nighttime light and glare from the Project are considered to be potentially significant.</u></p> <p>The Project would result in a potential for increases glare from within the Project Site during the day from reflective surfaces, and an increase in artificial light during the night. Given that minimal outdoor lighting is currently emitted from the Project Site, these impacts related to the additional nighttime light and glare from the Project are considered to be potentially significant.</p>			
---	--	--	--

ES-9-10 Table ES-2, Summary of Project Impacts, Cumulative Impacts, Aesthetics

<p><u>In combination with the Project, all of the proposed expansion areas would change the visual character of the area over time from a more rural setting to one with more urbanized development, especially along the main travel corridors, such as SR 126. The cumulative development would transform the visual character of the City by reducing the amount of open space within the City limits and expanding the urban visual character. However, implementation of the Project and related projects would be consistent with the City's General Plan. While the Santa Paula West Business Park Specific Plan would include various open space and would not affect the Adams Barranca, the development would contribute (albeit to a lesser degree) to the cumulative changes in visual character of the City in combination</u></p>	<p><u>Potentially Significant</u></p>	<p><u>No mitigation measures.</u></p>	<p><u>Significant and Unavoidable</u></p>
---	---------------------------------------	---------------------------------------	---

<p><u>with the other relatively large scale related projects. Therefore, as with the Project, impacts related to the views and visual character of the City as a result of the Specific Plan amendment, are considered cumulatively considerable, and significant and unavoidable.</u></p>			
--	--	--	--

ES-10-11 Table ES-2, Summary of Project Impacts, Agricultural Resources

<p>According to the FMMP Important Farmland Map for Ventura County, there are approximately 44.220 acres of prime farmland and 4.88 acres of farmland of statewide importance on the site (total of 49.081 acres). Implementation of the Specific Plan would result in the conversion of the 49.081 acres of both prime farmland and important farmland to urbanized uses. <u>Per Government Code Section 56064, the same amount of approximately 49.1 acres of Prime Agricultural Land would be developed.</u></p>	<p>Potentially Significant</p>	<p>AG-1: <u>To reduce or minimize impacts to Prime Farmland, and Important Farmland, and to Prime Farmland as defined in Section 56064 of the Government Code, the Applicant shall provide mitigation through one, or some combination of, the following mitigation measures, prior to the issuance of a grading permit by the City:</u></p> <ol style="list-style-type: none"> 1. <u>The Applicant shall secure a conservation easement in perpetuity, on land officially designated by the State of California as Prime Farmland and Important Farmland. The mitigation ratio shall be 1:1 for each class of designated farmland, resulting in a conservation easement being placed on a total of 44.20 acres of Prime Farmland and 4.88 acres of Important Farmland within the State of California. The applicant may satisfy the Important Farmland mitigation requirement by conserving Prime Farmland; or</u> 2. <u>The Applicant shall make payments to a local, regional, or statewide organization whose purpose is to acquire agricultural conservation easements for Prime Farmland and Important Farmland, and has demonstrated a successful track record in doing so, over at least 5 years. If the applicant elects to pursue this option alone, or in combination with option 1, the Applicant shall demonstrate to the City Planning Director that it has paid funds sufficient to</u> 	<p>Significant and Unavoidable</p>
--	--------------------------------	---	------------------------------------

		<p><u>allow the state, regional, or local conservation organization to acquire conservation easements in perpetuity over Prime Farmland and important Farmland resulting in a mitigation conservation ratio or 1:1 for each class of Farmland.</u></p> <p><u>If, prior to the issuance of a grading permit, the Applicant contends that satisfying mitigation options 1 and/or 2 is not financially feasible, the Applicant shall provide “substantial evidence” to the City Planning Director, as that term is defined in the CEQA Guidelines, including but not limited to expert opinion evidence supported by facts, to support its contention that such mitigation is not financially feasible. The Applicant’s substantial evidence shall be independently reviewed by the City’s financial experts or outside consultant, the cost of which shall be paid by the Applicant. If the City concurs with the Applicant’s conclusion that mitigation options 1 and/or 2 are not financially feasible, the Applicant shall provide mitigation at less than a 1:1 ratio, to the extent feasible, to minimize or reduce the level of impacts to Prime Farmlands and important Farmland.</u></p> <p>A-1: Before approval of a grading permits that will convert prime farmland as designated on the Department of Conservation’s most recent State Important Farmland Map, the applicant must record an agricultural conservation covenant, in a form approved by the City of Santa Paula, on other prime farmland currently under agricultural production within the City of Santa Paula’s Area of Interest.</p> <p>The area of the conservation covenant shall be based on the production value of the prime farmland being taken out of production. The production value shall be determined as the annual average of the total crop value for the four year period prior to the issuance of a grading permit. The conservation covenant shall provide for an equivalent amount of acreage to provide for the same</p>

		production value on the prime farmland being lost (e.g., if one acre of prime farmland being converted produces \$500,000 of crops per year, then an agricultural covenant shall be placed on one-half [½] acre of land producing \$1,000,000 per year.	
--	--	---	--

ES-13-14 Table ES-2, Summary of Project Impacts, Agricultural Resources

<p><u>On-Site Agriculture</u> As stated previously, approximately 49 acres of the 53.81-acre Project Site are under agricultural cultivation and would be taken out of production as a result of implementation of the Specific Plan.</p> <p><u>Adjacent Agriculture</u> Existing agricultural lands producing avocados, citrus fruits, and a variety of row crops are located south of the Specific Plan area, south of State Route (SR) 126, and near the western boundary of the Specific Plan area, west of Adams Barranca. Agricultural operations to the south are separated from the Project Site by SR 126. The Specific Plan would not readily accommodate outdoor recreational activities for the general public or provide residential habitation components. As such, residential and general public exposure to dust, noise, and odors associated with nearby farming activities is considered less than significant. Therefore, based on the nature of the Project and design features to reduce any conflicts with adjacent agricultural land, potential impacts related to the conversion of off-site farmland to</p>	<p><u>Potentially Significant for On-Site Agriculture</u></p> <p>Less than Significant for <u>Adjacent Agriculture</u></p>	<p><u>Implementation of Mitigation Measure AG-1.</u></p>	<p><u>Significant and Unavoidable for On-Site Agriculture</u></p> <p>Less than Significant for <u>Adjacent Agriculture</u></p>
---	--	--	--

nonagricultural uses would be less than significant.			
--	--	--	--

ES-14 Table ES-2, Summary of Project Impacts, Cumulative Impacts Agricultural Resources

Implementation of the General Plan would result in a long-term commitment to nonagricultural uses in areas that currently support prime and important Farmland soils, particularly within the West Area 2 and East Area 2 Expansion Areas. Since both of these expansion areas include statewide important farmland, development of these areas in accordance with the General Plan will result in cumulative impacts to agricultural resources within the City’s Planning Area. While development of these areas would be consistent with local planning policies, the cumulative impact on agricultural resources would be a significant and unavoidable impact.	<u>Significant</u>	<u>Implementation of Mitigation Measure AG-1.</u>	<u>Significant and Unavoidable</u>
--	--------------------	---	------------------------------------

ES-14-15 Table ES-2, Summary of Project Impacts, Air Quality

<u>According to the VCAPCD Guidelines, to be consistent with the AQMP, a project must conform to the local general plan and must not result in, or contribute to, an exceedance of the County’s projected population growth forecast.</u> <u>The Project’s addition of 1,510 employees would be consistent with the projections per SCAG. The planned uses would also be consistent with the City’s land use and zoning designation of the Project Site. As such, the</u>	Less than Significant	No mitigation measures necessary.	Less than Significant
--	-----------------------	-----------------------------------	-----------------------

<p><u>Project would not conflict with the 2007 AQMP and, as such, would not jeopardize attainment of state and national ambient air quality standards in Ventura County.</u></p> <p>The proposed Project will not increase the amount of housing within the Specific Plan area, as no residences are planned to be built. The project employment increase would be approximately 1,510 employees and would not result in SCAG projections being exceeded. Therefore, as growth under the Specific Plan is not expected, the Project would not conflict with the 2007 AQMP and, as such, would not jeopardize attainment of state and national ambient air quality standards in Ventura County. Therefore, impacts regarding consistency with applicable air quality are considered less than significant.</p>			
---	--	--	--

ES-15-16 Table ES-2, Summary of Project Impacts, Air Quality

<p><u>The VCAPCD's 25 lb/day threshold for ROG and NOx does not apply to construction emissions because such emissions are temporary. Emissions of TACs are localized, not regional, in nature; impacts related to construction activities would be limited to the area immediately surrounding the construction site within the Project area, and the VCAPCD does not recommend any thresholds of significance for their associated emissions. Instead, the VCAPCD bases the determination of significance on a consideration of the control measures to be implemented. If all appropriate emissions</u></p>	<p>Potentially Significant</p>	<p>AQ-1: During clearing, grading, earthmoving, or excavation operations, excessive fugitive dust emissions shall be controlled by regular watering or other dust-preventative measures using the following procedures, as specified by the VCAPCD (including without limitation, to VCAPCD Rule 50 (Opacity) and Rule 51 (Nuisance):</p> <ul style="list-style-type: none"> • On-site vehicle speed shall not to exceed 15 miles per hour (the Project Site will contain posted signs with the speed limit). • All on-site construction roads with vehicle traffic shall be watered <u>as necessary to prevent excessive dust periodically;</u> 	<p><u>Less than Significant</u></p>
--	--------------------------------	---	-------------------------------------

<p><u>control measures recommended by the VCAPCD Guidelines are implemented for a project, then construction emissions are not considered significant. All construction activities would adhere to the VCAPCD Rule 50 for Opacity, Rule 51 for Nuisance, and Rule 55 for Fugitive Dust.</u></p> <p>Construction activities associated with the construction of uses allowed with the Specific Plan would exceed VCAPCD threshold for ROG and NOx throughout the entire construction period and would be considered potentially significant.</p> <p>The construction emissions analysis was conducted for Year 2020, which was identified as the worst case year due to the overlapping construction activities of paving and architectural coating. ROG emissions from architectural coating exceeded the significance threshold.</p>		<ul style="list-style-type: none"> • Streets adjacent to the Project reach shall be swept as needed to remove silt that may have accumulated from construction activities so as to prevent excessive amounts of dust. • All material excavated or graded shall be sufficiently watered to prevent excessive amounts of dust. Watering shall occur at least twice daily with complete coverage, preferably in the late morning and after work is done for the day. • All clearing, grading, earth moving, or excavation activities shall cease during periods of high winds (i.e., greater than 25 miles per hour averaged over one hour) so as to prevent excessive amounts of dust (contact the VCAPCD meteorologist for current information about average wind speeds). • All material transported off site shall be either sufficiently watered or securely covered to prevent excessive amounts of dust. • The area disturbed by clearing, grading, earth moving, or excavation operations shall be minimized to prevent excessive amounts of dust. <p>These control techniques shall be indicated on Project grading plans. The Applicant and/or its contractor shall be responsible for implementing these measures and compliance with this measure will be subject to periodic site inspections by the City.</p> <p>AQ-2: Project grading plans shall show that for the duration of construction, ozone precursor emissions from construction equipment vehicles must be controlled by maintaining equipment engines in good condition and in proper tune per manufacturer’s specifications, to the satisfaction of the City Engineer. Compliance with this measure will be subject to periodic inspections of construction equipment vehicles by the Public Works Department.</p>	
---	--	--	--

		<p>AQ-3: All trucks that will haul excavated or graded material on site shall comply with California Vehicle Code Section 23114 with special attention to subsections 2311(b)(F), (e)(2) and (e)(4) as amended, regarding the prevention of such material spilling onto public streets and roads.</p> <p>AQ-4: A comprehensive Fugitive Dust Control Plan shall be developed by the Applicant and approved by the VCAPCD before the applicant commences grading and excavation operations. The Plan shall include all feasible, but environmentally safe, dust control methods. If a particular dust control method is determined or believed not to be feasible, or if it would conflict with other regulations, justification for not including the subject method shall be provided at the time the Fugitive Dust Control Plan is submitted to the VCAPCD. The Plan shall identify all fugitive dust sources, the means by which fugitive dust from each identified source will be minimized, and the schedule of frequency that each dust control method will be applied for each identified source.</p> <p>AQ-5: The construction contractor shall adhere to VCAPCD Rule 74.2 (Architectural Coatings) for limiting volatile organic compounds from architectural coatings. This rule specifies architectural coatings storage, clean up, and labeling requirements.</p>	
--	--	--	--

ES-17-18 Table ES-2, Summary of Project Impacts, Air Quality

<p>The Project would generate average daily operational emissions that exceed the thresholds of significance recommended by the VCAPCD for ROG. Many of the measures that the VCAPCD recommends to reduce the significant operational impacts are features of the Project. The off-site transportation demand management (TDM) fund is a</p>	<p>Potentially Significant</p>	<p>AQ-6: Use low emission water heaters for residential, retail, and commercial water heating (Emissions reduction of 11 percent for ROG and 9.5 percent for NOx).</p> <p>AQ-7: Construct pedestrian and transit friendly facilities such as wider sidewalks, bus stops with passenger benches and shelters, and bikeways and or lanes <u>and bike racks</u>.</p>	<p>Significant and Unavoidable</p>
--	--------------------------------	---	------------------------------------

<p>mitigation measure that can be used by project proponents for projects and program that exceed the ROG and NOx significance thresholds. The City of Santa Paula utilizes this program to mitigate the significant air quality impacts of projects with its jurisdiction. While impacts will be reduced with mitigation, they will remain significant and unavoidable.</p>		<p>Sidewalks and bikeways should be landscaped with trees (an approximately 4 percent emissions reduction).</p> <p>AQ-8: Provide shuttle/minibus service between the Project commercial and industrial land uses and the Project retail land uses and the Santa Paula downtown area during the lunchtime period (11:00 AM to 2:00 PM).</p>	
--	--	---	--

ES-18-19 Table ES-2, Summary of Project Impacts, Air Quality

<p>According to the VCAPCD, if an individual project results in air emissions of criteria pollutants that exceed VCAPCD's recommended daily thresholds for project-specific impacts, then the project would also result in a cumulatively considerable net increase of these criteria pollutants. By applying VCAPCD's cumulative air quality impact methodology, implementation of the Project would result in an increase of ROG, an ozone precursor, and NOx, such that significant cumulative impacts would occur. Accordingly, cumulative impacts would be potentially significant.</p>	<p>Potentially Significant</p>	<p>AQ-12: The Applicant and/or its contractor must plant and maintain shade trees to reduce heat build-up on structures.</p> <p>AQ-13: The Applicant and/or its contractor shall prepare a TDM for review and approval by the City and VCAPCD, before the City issues building permits. The plan shall incorporate reasonable and feasible measures to reduce Project-related traffic and vehicle miles traveled. At minimum, the TDM Program shall include the following measures:</p> <ul style="list-style-type: none"> • Provision of connections to identified adjacent City or regional trails. • Provision of adequate way-finding features to direct pedestrians and bicyclists to nearby Project and City destinations, such as school, retail, and civic facilities. • Provision of homeowner information packets prior to close of escrow, identifying local and regional nonvehicular transportation options, and providing homeowners with basic information regarding telecommuting options. • Provision of adequate setbacks and design features such that the proposed future enhancement of 	<p><u>Significant and Unavoidable</u></p>
--	--------------------------------	---	---

		<p>commuter rail opportunities is not hindered by Project design.</p> <ul style="list-style-type: none"> • Construction of pedestrian- and transit-friendly facilities such as wider sidewalks, bus stops with passenger benches and shelters, bikeways, or lanes. Sidewalks and bikeways should be landscaped with trees. • Perform a traffic light synchronization study on streets impacted by Project development to reduce vehicle queuing time. <p>The Project shall offset the increase in daily emission over the 25 pounds of reactive organic compounds and nitrogen oxides per day either through the purchase of emission offsets or through the in-lieu fees shall be paid to fund off-site TDM facilities or services, if such a program has been established at that time. These fees can reduce emissions from non-Project-generated motor vehicle trips by funding programs to promote ridesharing, public transit, and bicycling. The amount of this financial contribution should be calculated on a pro-rate basis as determined to be equitable by the VCAPCD, and in accordance with the VCAPCD Guidelines. These fees should be paid prior to the issuance of building permits by the County. The applicant shall demonstrate the availability of the offsets or contribution to fund off-site TDM services to the VCAPCD through a contract or other agreement with the offset source(s), which binds the reduction to the Project.</p> <p>AQ 14: The Applicant and/or its contractor shall install EPA-certified wood burning stoves or fireplace inserts. If this is not feasible, then the installation of a ceramic coating on the honeycomb inside a catalytic combustor must be utilized or the use of natural gas fireplaces may be used as a feasible alternative.</p>	
--	--	---	--

ES-20 Table ES-2, Summary of Project Impacts, Air Quality

<p>An HRA was prepared to determine whether diesel particulate emissions from construction under <u>within</u> the Santa Paula West Specific Plan will cause significant impacts to nearby sensitive receptors. In comparison to the <u>applicable</u> 10 in 1 million threshold level, carcinogenic risks do not exceed the level posing no significant risk. Therefore, impacts are less than significant.</p>	<p>Less than Significant</p>	<p>No mitigation measures necessary.</p>	<p>Less than Significant</p>
---	------------------------------	--	------------------------------

ES-21 Table ES-2, Summary of Project Impacts, Air Quality

<p>The uses allowed by the Santa Paula West Business Park Specific Plan do not include any operations that require large amounts of hazardous materials <u>that could pose a significant health risk</u>. Accordingly, the Project will not result in a significant impact with respect to use of hazardous materials during long-term operations.</p>	<p>Less than Significant</p>	<p>No mitigation measures necessary.</p>	<p>Less than Significant</p>
<p>The types of industrial activities that would occur with the Project are not known at this time, but would be evaluated at the time that permits to construct and operate are applied for from the APCD. Therefore, the potential impacts associated with objectionable odors will be less than significant.</p>	<p>Less than Significant</p>	<p>No mitigation measures necessary.</p>	<p>Less than Significant</p>

ES-21-22 Table ES-2, Summary of Project Impacts, Cumulative Impacts, Air Quality

<p>The Project would not have a cumulatively considerable contribution to this impact with respect to conflicting with or obstructing the implementation of the applicable air quality plan.</p>	<p>Less than Significant</p>	<p>No mitigation measures necessary.</p>	<p>Less than Significant</p>
<p>Cumulative development activity within the City of Santa Paula would continue to implement dust control and equipment emissions mitigation measures during construction in accordance with City practices. Consequently, cumulative development within the city is not expected to cause a significant impact associated with construction activities.</p>	<p>Less than Significant</p>	<p>No mitigation measures necessary.</p>	<p>Less than Significant</p>
<p><u>The Project would not have a cumulatively considerable contribution to this impact with respect to conflicting with or obstructing the implementation of the applicable air quality plan.</u></p> <p><u>Cumulative development activity within the City of Santa Paula would continue to implement dust control and equipment emissions mitigation measures during construction in accordance with City practices. Consequently, cumulative development within the city is not expected to cause a significant impact associated with construction activities.</u></p> <p><u>However, because</u> Ventura County is currently in nonattainment for ozone, related projects could exceed an air quality standard or contribute to an existing or projected air quality exceedance. Therefore,</p>	<p><u>Significant</u></p>	<p>Implementation of mitigation measures AQ-6 through AQ-8 and AQ-12 through AQ-134.</p>	<p>Significant and Unavoidable</p>

the emissions generated by the Project would be cumulatively considerable and are a significant and unavoidable impact.

ES-23 Table ES-2, Summary of Project Impacts, Biological Resources

<u>The Project includes the dedication of Open Space for the areas identified as Mixed Willow Riparian, and no development would occur within the Mixed Willow Riparian habitat area, potential impacts to vegetation communities are considered less than significant.</u>	<u>Less than Significant</u>	<u>No mitigation measures necessary.</u>	<u>Less than Significant</u>
Southern California black walnut (<i>Juglans californica</i>) is the only special-status plant species that was documented or determined to have a high likelihood of occurring within the Project Site. A total of 19 individual trees are located along the perimeter of the Project Site, mainly along the southwest boundary within the riparian habitat of the Adams Barranca and along the SR 126 right-of-way along the southeast boundary of the Project Site, <u>however, the Project does not currently propose to remove any of the 19 Southern California black walnut trees.</u> Therefore, i mpacts to special-status plant species (e.g. black walnut) are considered potentially significant.	Potentially Significant	BR-1 Before issuance of a grading permit, the Applicant must identify on grading plans, the locations of any protected trees (such as the Southern California black walnut, <i>Juglans californica</i>) and must include a report pertaining to preserving the tree(s) that could be affected by the grading activity. The report shall be prepared by a tree expert and shall evaluate the subdivider's <u>Applicant's</u> proposals for protected tree preservation, including avoiding grading, land movement, or other activity within the drip line of any protected tree. Prior to grading, the drip line must be fenced to prevent earthmoving equipment from inadvertently entering the drip line. In the event protected tree cannot be avoided, then the Applicant must provide a tree report in accordance with the City's Tree Protection Ordinance and must provide for the replacement or relocation of any protected trees that are to be removed, or would be subject to landmoving or grading within its drip line.	Less than Significant
The Southwestern willow flycatcher breeds in dense riparian habits along rivers and streams, and almost all southwestern flycatchers breeding habitat is within close	Potentially Significant	BR-3 <u>To avoid impacts to native nesting birds, the Applicant must retain a qualified biologist (with selection to be approved by the City) to conduct nest surveys in potential nesting habitat within the Project Site prior to</u>	Less than Significant

<p>proximity of water or saturated soils. The Project includes construction activity that could result in a temporary impact to the species if members are foraging or in the unlikely event they nest near the Project Site at the time of construction. Therefore, impacts are considered potentially significant.</p> <p>The Project is consistent with the recovery plan for this species because if southwestern willow flycatchers are located on site, they would not be permanently impacted. Although, the Project would result in potentially significant impacts to the southwestern willow flycatcher, mitigation measures are included within this EIR, and the Project includes an Open Space dedication along the western boundary to avoid impacts to habitat for southwestern willow flycatcher individuals in the Santa Clara River Watershed.</p>		<p><u>construction or site preparation activities. Specifically, within 30 days of ground disturbance activities associated with construction or grading, a qualified biologist shall conduct weekly surveys to determine if active nests of bird species protected by the Migratory Bird Treaty Act (MBTA) or the California Fish and Wildlife Code are present in the construction zone or within 300 feet (500 feet for raptors) of the construction zone. Surveys for special-status bird species can be conducted concurrently with general nesting bird surveys. Because birds known to use the Project area nest during the late winter, breeding bird surveys shall be carried out both during the typical nesting/breeding season (mid-March through September) and in January and February. The surveys shall continue on a weekly basis, with the last survey being conducted no more than 3 days prior to initiation of clearance or construction work. If ground disturbance activities are delayed, then additional pre-construction surveys shall be conducted such that no more than 3 days shall have elapsed between the last survey and the commencement of ground disturbance activities. Surveys shall include examination of trees, shrubs, and the ground within grassland for nesting birds, as several bird species known to occur in the area and are shrub or ground nesters, including burrowing owl, California horned lark, and mourning dove. In addition, due to the potential for least Bell's vireo and southwest willow flycatcher to exist, protocol surveys should be completed prior to the start of construction.</u></p> <p>BR-4 <u>If active nests are found, clearing and construction activities within 300 feet of the nest (500 feet for raptors) shall be postponed or halted until the nest is vacated and juveniles have fledged, as determined by the qualified biologist, and there is no evidence of a second attempt at nesting. Limits of construction to avoid an active nest shall be established in the field with flagging, fencing, or other appropriate barriers, and construction personnel</u></p>	
---	--	--	--

		<p><u>shall be instructed on the sensitivity of nest areas. The biologist shall serve as a construction monitor during those periods when construction activities would occur near active nest areas to ensure that no inadvertent impacts to these nests will occur. The results of the survey, and any avoidance measures taken, shall be submitted to the City of Santa Paula within 30 days of completion of the pre-construction surveys and construction monitoring to document compliance with applicable state and federal laws pertaining to the protection of native birds.</u></p> <p>Implementation of mitigation measure BR-2 would ensure that impacts to Southwestern willow flycatcher habitat, Adams Barranca, would remain less than significant.</p>	
<p>The least Bell's vireo was not observed during the Project surveys; however, Adams Barranca provides potential habitat for the species. Impacts are considered potentially significant in the unlikely event this species nests on site or in the immediate vicinity and is subject to disturbance from construction activity.</p> <p>The Project is consistent with the recovery plan for this species because the least Bell's vireo habitat present on the site would not be impacted. The Project would result in potentially significant impacts to the least Bell's vireo. However, mitigation measures are included within this EIR, and the Project would include an Open Space dedication along the western boundary to avoid impacts to habitat for least Bell's vireo individuals in the Santa Clara River Watershed.</p>	<p>Potentially Significant</p>	<p>Implementation of mitigation measure BR-3 and BR-42.</p>	<p>Less than Significant</p>

<p>Although, \mp the Pallid bat was not observed during the Project surveys, Adams Barranca provides foraging and roosting habitat for the species. Construction under the Specific Plan could result in potentially significant impacts to pallid bats.</p> <p>The Hoary Bat was not observed during the Project Surveys, however, Adams Barranca provides foraging and roosting habitat for the species. This species is not expected to breed in Adams Barranca but may use the habitat for roosting, and the agricultural areas of Project Area for foraging.</p>	<p>Potentially Significant</p>	<p>BR-6 To avoid <u>potential</u> impacts to the Pallid bat (<i>Antrozous pallidus</i>) and the Hoary Bat (<i>Lasiurus cinereus</i>), the Applicant must retain a qualified biologist (with selection to be reviewed by the City) to conduct roosting bat surveys within the Specific Plan area prior to site preparation activities. Thirty days before ground disturbance activities associated with construction or grading, a qualified biologist shall conduct weekly surveys in accordance with standard protocols to determine if roosting western red bats are present in the construction zone or within 300 feet of the construction zone. Roosting bat surveys shall be carried out from March through September. Surveys for special-status bat species may be conducted concurrently with nesting bird surveys. The surveys shall continue on a weekly basis, with the last survey being conducted no more than 3 days prior to initiation of clearance or construction work. If ground disturbance activities are delayed, then additional pre-construction surveys shall be conducted such that no more than three days shall have elapsed between the last survey and the commencement of ground disturbance activities. Surveys shall include examination of trees and large shrubs in which this species is known to roost. Any bats found outside of the breeding season (May through August) shall be relocated by having a qualified biologist remove the bat from the roost. If roosting female bats are found with young during the breeding season (May through August) clearing and construction activities within 300 feet of the roost, shall be postponed or halted until the roost is vacated and juveniles have been weaned, as determined by the biologist. Limits of construction to avoid an active roost site shall be established in the field with flagging, fencing, or other appropriate barriers. Construction personnel shall be instructed on the sensitivity of nest areas. The biologist shall serve as a construction monitor during those periods when construction activities will occur near active roost areas to ensure that no</p>	<p>Less than Significant</p>
--	--------------------------------	---	------------------------------

		<p>inadvertent impacts on these roosts will occur. The results of the survey, and any avoidance measures taken, shall be submitted to the City of Santa Paula within 30 days of completion of the pre-construction surveys and construction monitoring to document compliance with applicable state and federal laws pertaining to the protection of these bat species.</p>	
--	--	---	--

ES-27-32 Table ES-2, Summary of Project Impacts, Biological Resources

<p>No active bird nests were observed at the time of survey; however, suitable nesting habitat is present within the avocado orchard, ornamental trees within the Project area, and adjacent trees to the Project Site and within Adams Barranca. However, impacts to nesting birds may be potentially significant.</p>	<p>Potentially Significant</p>	<p><u>Implementation of mitigation measure BR-3 and BR-4.</u> BR-3 To avoid impacts to native nesting birds, the Applicant must retain a qualified biologist (with selection to be reviewed by the City) to conduct nest surveys in potential nesting habitat within the Project Site prior to construction or site preparation activities. Specifically, within 30 days of ground disturbance activities associated with construction or grading, a qualified biologist shall conduct weekly surveys to determine if active nests of bird species protected by the Migratory Bird Treaty Act (MBTA) or the California Fish and Wildlife Code are present in the construction zone or within 300 feet (500 feet for raptors) of the construction zone. Surveys for special status bird species can be conducted concurrently with general nesting bird surveys. Because birds known to use the Project area nest during the late winter, breeding bird surveys shall be carried out both during the typical nesting/breeding season (mid-March through September) and in January and February. 		<p>activities. Surveys shall include examination of trees, shrubs, and the ground within grassland for nesting birds, as several bird species known to occur in the area and are shrub or ground nesters, including burrowing owl, California horned lark, and mourning dove.</p> <p>BR-4 If active nests are found, clearing and construction activities within 300 feet of the nest (500 feet for raptors) shall be postponed or halted until the nest is vacated and juveniles have fledged, as determined by the qualified biologist, and there is no evidence of a second attempt at nesting. Limits of construction to avoid an active nest shall be established in the field with flagging, fencing, or other appropriate barriers, and construction personnel shall be instructed on the sensitivity of nest areas. The biologist shall serve as a construction monitor during those periods when construction activities would occur near active nest areas to ensure that no inadvertent impacts to these nests will occur. The results of the survey, and any avoidance measures taken, shall be submitted to the City of Santa Paula within 30 days of completion of the pre-construction surveys and construction monitoring to document compliance with applicable state and federal laws pertaining to the protection of native birds.</p>	
<p>Development under the Specific Plan would require the removal of the agricultural drainage ditch that bisects the Project Site and is considered State Waters pursuant to the Fish and Game Code and the Clean Water Act. Other state and federal jurisdictional waters (i.e., those within Adams Barranca) would be preserved through an Open Space dedication and prevention of construction activities within the Barranca. <u>All Project impacts to ACOE and CDFW jurisdictional areas are considered potentially significant, and would be mitigated to a less than</u></p>	<p>Potentially Significant</p>	<p>BR-7 Before the issuance of a grading permit for areas that require state permits, the applicant shall coordinate with the CDFW to verify the impact to state-protected waters and associated vegetation on the Project Site. A Streambed Alteration Agreement (SAA) must be obtained, and mitigation measures recommended by the CDFW as part of the SAA shall be implemented. The SAA shall be provided to the City prior to issuance of a grading permit.</p> <p>The Applicant must mitigate for impacts to jurisdictional waters as administered by the CDFW jurisdiction by restoring habitats within those jurisdictions acceptable</p>	<p>Less than Significant</p>

<p><u>significant level through the conditions imposed pursuant to the Project's 404, 401, and 1602 permits/agreement as well as by mitigation measures identified in this EIR.</u></p>		<p>to the resource agency. Habitat must be mitigated onsite or within the same watershed, if feasible.</p> <ul style="list-style-type: none"> • The mitigation site(s) shall have been evaluated and selected on the basis of their suitability for use as riparian mitigation areas. • The mitigation area shall provide procedures to prepare soils in the mitigation area, provide detailed seeding/planting mixtures, provide seeding/planting methods, and other procedures that will be used for successful re-vegetation. • Impacts to jurisdictional waters shall be avoided to the extent feasible in the design phase of the Project. • Maintenance and monitoring requirements shall be established, including quarterly and annual monitoring reports to CDFW. <p>BR-8 Prior to the issuance of a grading permit for areas that require state or federal permits, the applicant and/or its contractor shall coordinate with the Army Corps of Engineers (ACOE) to verify the impact to federally regulated waters on the Project Site. A Nationwide Permit (NWP) shall be obtained and mitigation measures recommended by the ACOE and National Marine Fisheries, as part of the NWP shall be implemented. The NWP shall be provided to the City prior to initiating construction of the bridge crossing Santa Paula Creek.</p> <p>Areas determined to be federally regulated by the ACOE shall also fall under the jurisdiction of the Regional Water Quality Control Board (RWQCB), and a Clean Water Act Section 401 Water Quality Certification (401 Certification) will be required from the RWQCB for impacts to those areas.</p> <p>BR-9 For impacts to Regional Board jurisdiction, the Applicant shall:</p>	
---	--	--	--

		<ul style="list-style-type: none"> • Establish, reestablish, rehabilitate, and/or enhance a minimum of 1:1 mitigation-to-impact ratio) on site; or • Provide a one-time in-lieu fee to a Regional Board–approved mitigation bank and/or in-lieu fee program within the Santa Clara River Watershed (at a minimum 1:1 mitigation-to-impact ratio) to establish, re-establish, rehabilitate, and/or enhance a minimum of 1.27 acres of Regional Board jurisdiction; or • A combination of on-site and/or off-site compensatory mitigation options, as described above. <p>BR-10 As mitigation impacts to CDFW jurisdiction, the Applicant shall:</p> <ul style="list-style-type: none"> • Establish, reestablish, rehabilitate, and/or enhance a minimum of 1:1 mitigation-to-impact ratio acres of CDFW jurisdiction for loss of State Waters; or • Provide a one-time in-lieu fee to a CDFW-approved mitigation bank and/or in-lieu fee program within the Santa Clara River watershed (at a minimum 1:1 mitigation-to-impact ratio) to establish, re-establish, rehabilitate, and/or enhance a minimum of 1:1 CDFW jurisdiction area; or <p>A combination of on-site and/or off-site compensatory mitigation options, as described above.</p>	
<p>The development of the Project Site would increase the number of nighttime light and glare sources on the site. Light and glare can “spill over” into adjacent open space areas, increasing the level of light currently experienced there. Nighttime light can disturb breeding and foraging behavior and can potentially alter foraging and breeding behavior of nocturnal birds, mammals, and</p>	<p><u>Less than Significant</u> Potentially Significant</p>	<p>Implementation of mitigation measure BR-2. <u>No mitigation necessary.</u> <u>Implementation of mitigation AES-1 which includes the installation of low intensity, low-glare design, and hooded to direct light downward preventing spillover into adjacent areas would further reduce impact.</u></p>	<p>Less than Significant</p>

<p>invertebrates, which is considered a potentially significant impact. <u>Section 4.6 of the Specific Plan for the proposed Project addresses lighting guidelines for the Project Site, including but not limited to, height of lighting, requirements for screened lighting, and submittal of a lighting plan to the police Chief or designee for approval prior to issuance of a building permit. Impacts from lighting and glare would be considered less than significant.</u></p>			
<p>Development under the Project can be expected to increase human activity near Adams Barranca, which could result in an increase in the frequency of human encroachment into the Barranca when compared to existing conditions. The Open Space <u>area</u> designations of the Specific Plan, upland buffers from the riparian area and development under the Project, and the Project characteristics that would provide predominantly indoor daytime work areas would minimize any potential for increase human disturbance to the Adams Barranca. Therefore, indirect impacts from human encroachment would be less than significant.</p>	<p>Less than Significant</p>	<p>No mitigation necessary.</p>	<p>Less than Significant</p>
<p>Invasive exotic species introduced as landscaping could be dispersed by stormwater, wind, or wildlife, or by various other means to natural habitats in the area, including Adams Barranca and other downstream water bodies, such as the Santa Clara River. Impacts from the introduction of invasive exotic landscape plants could be potentially significant.</p>	<p>Potentially Significant</p>	<p>BR-2 Before issuance of a grading permit for development within the Specific Plan area, a landscaping and irrigation plan must be prepared and must incorporate the planting of native vegetation and use of water conserving irrigation. The landscaping and irrigation plan must be prepared by a licensed landscape architect, and use native plant and tree species. The landscape and irrigation plan must be submitted to the City of Santa Paula Planning Department for review and approval.</p>	<p>Less than Significant</p>

		<p>Nonnative plants or vegetation must be avoided in future development areas. The landscaping plans within common areas of development areas must include appropriate provisions to prevent other invasive plant species from colonizing remaining natural areas. These provisions must include the following: (a) review and screening of proposed plant palette and planting plans to identify and avoid the use of invasive species; (b) weed removal during the initial planting of landscaped areas; and (c) the monitoring for and removal of weeds and other invasive plant species as part of ongoing landscape maintenance activities. The frequency and method of monitoring for invasive species must be determined by a qualified botanist.</p> <p>For areas adjacent to Adams Barranca riparian corridors, the plan must provide for adequate landscaping to reduce indirect impacts including attenuation of noise and reduction of nighttime lighting and glare.</p>	
--	--	--	--

ES-34 Table ES-2, Summary of Project Impacts, Biological Resources

<p>Adams Barranca, located along the western border of the Project Site could provide a wildlife movement corridor with linkage between the foothills of the mountains north of the City and the Santa Clara River, <u>however, the Project does not propose to obstruct or develop in the Barranca. The Project would not result in potentially significant impacts to the movement of resident or migratory fish or terrestrial wildlife species.</u> No historical or active raptor nests or communal roosts exist at the Project Site or within 100 feet of any area that is or will be subject to development within the Project Site. Raptors are mobile species with</p>	<p>Less than Significant</p>	<p>No mitigation necessary.</p>	<p>Less than Significant</p>
---	------------------------------	---------------------------------	------------------------------

<p>generally large home ranges, they are capable of compensating for the loss of small acreages of foraging habitat in a local area by moving to other suitable foraging habitats. Therefore, development of the Project would not eliminate significant raptor foraging areas or limit raptors' access to food resources, making potential impacts to raptors due to the development of the Project less than significant.</p>			
---	--	--	--

ES-35 Table ES-2, Summary of Project Impacts, Biological Resources

<p><u>The Project is consistent with the recovery plan for this the least Bell's vireo because the least Bell's vireo habitat present on the site would not be impacted. All potential impacts to the least Bell's vireo during construction would be mitigated by measures are included in this EIR, and the Project would include an Open Space dedication along the western boundary to avoid impacts to habitat for least Bell's vireo individuals in the Santa Clara River Watershed.</u></p>	<p><u>Potentially Significant</u></p>	<p><u>Implementation of mitigation measure BR-2.</u></p>	<p><u>Less than Significant</u></p>
<p><u>All potential impacts to the southwestern willow flycatcher during construction would be mitigated by measures included in this EIR, and the Project includes an Open Space dedication along the western boundary to avoid impacts to habitat for southwestern willow flycatcher individuals in the Santa Clara River Watershed. The southwestern willow flycatchers would not be permanently impacted, and therefore the Project is consistent with the recovery plan.</u></p>	<p><u>Potentially Significant</u></p>	<p><u>Implementation of mitigation measure BR-2.</u></p>	<p><u>Less than Significant</u></p>

ES-35-36 Table ES-2, Summary of Project Impacts, Cumulative Impacts, Biological Resources

<p><u>Most wildlife species that could be expected to use the Project Site are species that are adapted to the disturbance that is caused by human-induced activities. Because of the present condition of the Project Site and the surrounding lands, it is unlikely that development of the site would contribute significantly to cumulative adverse impacts to regional flora and fauna. However, the loss of habitat associated with development of the Project area would contribute to the overall cumulative loss of biological resources in the Santa Paula region. Given that the impacted habitat within the Project area consists primarily of agricultural and urban developed land, and the impacted waters are small (less than 1 acre), the incremental contribution of the Project to this habitat loss is not cumulatively considerable.</u></p>	<p><u>Less than Significant</u></p>	<p><u>No mitigation necessary.</u></p>	<p><u>Less than Significant</u></p>
--	-------------------------------------	--	-------------------------------------

ES-38 Table ES-2, Summary of Project Impacts, Cultural Resources

<p>A majority of the Project Site has been extensively farmed with various row crops and orchards, which has continually disturbed the surface of the soils. While the Project Site does not contain any known sensitive archaeological resources within the disturbance area, the general Santa Clara River Valley is considered sensitive, and there is potential for unknown resources to be uncovered by activities, such as grading, that disturb the ground surface.</p>	<p>Potentially Significant</p>	<p>CUL-3: In the event that previously unidentified archaeological resources are discovered during building construction, the contractor must cease work in the immediate area and the City Planning Director shall be contacted. An independent qualified archaeologist, retained by the City at the expense of the applicant, must assess the significance of the find and make mitigation recommendations, <u>which shall be implemented to the extent feasible.</u></p>	<p>Less than Significant</p>
--	--------------------------------	--	------------------------------

ES-39 Table ES-2, Summary of Project Impacts, Cumulative Impacts, Cultural Resources

<p><u>Potential impacts to cultural resources within the Project Site would be mitigated to less than significant with implementation of mitigation measures. Other Specific Plan projects that would likely have similar potentially significant impacts to paleontological, archaeological, and historic resources include the remainder of West Area 2, Adams Canyon, Fagan Canyon, and East Area 1 Specific Plan and East Area 2 Projects. The Project, in combination with other currently planned projects, may result in the potential for a cumulatively significant contribution to significant cumulative impacts. However, mitigation measures would reduce the potentially significant cumulative contribution to paleontological, archaeological, and historical resources.</u></p>	<p><u>Less than Significant</u></p>	<p><u>No mitigation necessary.</u></p>	<p><u>Less than Significant</u></p>
--	-------------------------------------	--	-------------------------------------

ES-40 Table ES-2, Summary of Project Impacts, Geology and Soils

<p>The Specific Plan area could be subject to strong ground shaking in the event of an earthquake originating along one of the <u>nearby faults listed in Table 4.6-1</u> (or another active or potentially active in the Southern California area, such as the San Andrea Fault). Construction allowed by the Specific Plan will be required to comply with the version of the CBC in effect at the time individual building permits are obtained. The Project will not expose residents to unknown safety issues associated with seismicity (including ground</p>	<p>Less than Significant</p>	<p>No mitigation necessary.</p>	<p>Less than Significant</p>
---	------------------------------	---------------------------------	------------------------------

shaking), and potential impacts are less than significant.			
--	--	--	--

ES-41 Table ES-2, Summary of Project Impacts, Geology and Soils

<p>Most of the Project Site lies within a liquefaction hazard zone, an area where the historic occurrence of liquefaction or groundwater conditions indicate a potential for ground displacements as a result of liquefaction, as designated by the State of California and the City of Santa Paula. Settlement caused by ground shaking is often not uniformly distributed, which can result in differential settlement. If settlement occurs, it could result in damage to improvements. Seismic settlement could occur on the site and is thus considered a potentially significant impact.</p>	Potentially Significant	<p>G-1: Additional explorations must be performed at the tentative tract map and grading plan review stages of the development planning. The purpose of the explorations would be to establish required removal depths and delineate any portion of the Project Site deemed susceptible to seismically induced settlement. <u>The Project shall comply with all CBC/UBC requirements for seismic safety.</u></p>	Less than Significant
<p>The native topsoil and alluvial soils in the annexation area may be moderately susceptible to erosion. Construction activities would comply with erosion control requirements, including <u>existing</u> grading and dust control measures, imposed by the City pursuant to grading permit regulations. After construction, the project may result in a limited degree of soil erosion effects from vegetated areas. However, in accordance with NPDES requirements, the project would be required to have a Standard Urban Stormwater Mitigation Plan (SUSMP) in place during the operational life of each development within the Specific Plan. While BMP design features would be developed with more refined engineering for each</p>	Potentially Significant	<p>G-2: Detailed, design-level geotechnical investigation reports for all future subdivision and other discretionary development approvals must be submitted to the Public Works Director, or designee, for approval. In addition, grading plans and geotechnical reports prepared by a licensed Engineering Geologist (approved by the Public Works Director) must be provided to the Public Works Director, or designee, before the City issues grading building permits for individual development projects within the Project Site. Requirements for the geotechnical reports and compliance are described below.</p> <ul style="list-style-type: none"> The Engineering Geologist must make recommendations to address any seismically induced settlement within portions of the Project Site. In particular, seismically induced settlement 	Less than Significant

<p>development prior to implementation of the above requirements, impacts associated with erosion and sedimentation are considered potentially significant.</p>		<p>must be addressed in the western parts of the Project Site, where preliminary geotechnical investigations determined that the area may experience up to several inches of seismically induced settlement in the event of strong ground motion.</p> <ul style="list-style-type: none"> • The Engineering Geologist must inspect and certify that any expansive soils underlying individual building pads and all roadway subgrades have been either removed or amended in accordance with construction specifications, and make site-specific recommendations for grading, drainage installation, and foundation design, as appropriate. • The Public Works Director, or designee, must ensure that all soils and engineering report recommendations are incorporated into the project engineering and construction plans, including soils tests to ensure that it meets the soil classifications assumed in the soils reports, and that soils meet the CBC requirements. • All Project plans as determined necessary by the Public Works Director, or designee, including Grading and Construction Plans, must be reviewed and stamped by a Project soils engineer and submitted to the Public Works Director, or designee, for review and verification that all requirements are incorporated before the City issues grading or construction permits. • The Applicant and/or contractor must retain a licensed soils engineer acceptable to the Public Works Director, or designee, to review all construction plans for consistency with the soils reports and to monitor on-site grading and construction to ensure the conditions at the Project Site do not substantially change the requirements of report recommendations for design-level geotechnical investigations. The project soils 	
---	--	---	--

		<p>engineer must monitor grading and construction activity and report observations to the Public Works Director, or designee. The Public Works Director, or designee, will conduct field inspections as needed.</p>	
--	--	---	--

ES-44-45 Table ES-2, Summary of Project Impacts, Cumulative Impacts, Geology and Soils

<p><u>At a minimum, all development occurring within the City of Santa Paula would be subject to CBC and construction standards relative to seismic and other geologic conditions that are prevalent within the region. Also, individual project geotechnical investigation reports, required prior to permit approval, would provide recommendations to account for site-specific design requirements to avoid subjecting on- and off-site properties to geologic hazards, in accordance with the CBC. With regard to erosion and sedimentation, development under the Santa Paula West Specific Plan and related projects are required to implement a SWPPP during construction, as required by the NPDES permit, to minimize impacts to off-site properties from the effects of erosion. The Project will meet the applicable standards and will sufficiently reduce its incremental cumulative geology and soil impacts to a less than significant cumulative impact.</u></p>	<p><u>Less than Significant</u></p>	<p><u>No mitigation necessary.</u></p>	<p><u>Less than Significant</u></p>
---	-------------------------------------	--	-------------------------------------

ES-45 Table ES-2, Summary of Project Impacts, Greenhouse Gasses

<p><u>GHG emissions reductions would be achieved through energy-efficient lighting and building design; installation of low-flow appliances; and water conservation. The methods used to establish this relative reduction are consistent with the approach used in the CARB’s Scoping Plan for the implementation of AB 32 through 2020. The Project’s features and GHG reduction measures make the Project consistent with the goals of AB 32. Therefore, the Project will result in a less than significant contribution to cumulatively significant GHG emissions.</u></p> <p>Given the Specific Plan’s consistency with state and county GHG emission reduction goals and objectives, the Specific Plan’s contribution to the cumulative impact of greenhouse gas emissions would not be cumulatively considerable and would not conflict with any applicable plan, policy or regulation of an agency adopted for the purpose of reducing the emissions of GHGs (i.e., the 2014 Updated Scoping Plan). Similarly, related projects would also be anticipated to comply with these same emissions reduction goals and objectives. Therefore, cumulative impacts with respect to greenhouse gas emissions would be less than significant.</p>	<p>Less than Significant</p>	<p>No mitigation necessary.</p>	<p>Less than Significant</p>
---	------------------------------	---------------------------------	------------------------------

ES-46-47 Table ES-2, Summary of Project Impacts, Hazards and Hazardous Materials

<p><u>Construction of the Project would involve deliveries and disposal of hazardous materials such as fuels, oils, solvents, and other equipment maintenance and building materials.</u> Spills or leakages encountered during construction and hauling would be temporary and would be required to be remediated in accordance with the State and local regulations for hazardous waste cleanup. As such, impacts from the use and handling of hazardous materials would be less than significant.</p>	<p>Less than Significant</p>	<p>No mitigation necessary.</p>	<p>Less than Significant</p>
--	------------------------------	---------------------------------	------------------------------

ES-47-48 Table ES-2, Summary of Project Impacts, Hazards and Hazardous Materials

<p>If the railroad is commissioned for service within the future, any transport of hazardous materials would comply with US Department of Transportation (USDOT) Federal Railroad Administration (FRA) safety regulations. Therefore, the probability of an accident involving the transport of hazardous materials within proximity to the Project Site is considered to be <u>very low unlikely</u>. Impacts would be less than significant.</p>	<p>Less than Significant</p>	<p>No mitigation necessary.</p>	<p>Less than Significant</p>
<p>During construction of the Project, delivered materials to the site could contain hazardous materials, such as fuels, solvents, oils, coatings, etc. The event of a spill or release related to these hazardous materials could cause a short-term threat of exposure to nearby schools and residential areas along SR 126 and W. Telegraph Road. Therefore, the Project would</p>	<p>Potentially Significant</p>	<p>HM-1: Prior to demolition and construction activities on the Project Site, the Applicant shall submit verification to the City of Santa Paula Building and Safety Department that an asbestos survey has been conducted on any buildings and irrigation pipelines that are to be demolished or removed from the Project Site. If asbestos is found, the Applicant shall follow all procedural requirements and regulations of the VCAPCD Rule</p>	<p>Less than Significant</p>

<p>have potentially significant impacts related to the transport of hazardous materials during construction activities.</p> <p><u>The Project Site has been historically used for agricultural uses for more than 75 years, it is possible that residual pesticides may be exposed during grading and excavation activities. The limited Phase II ESA conducted for the Project Site determined that exposure of residual pesticides is considered low. However, soil testing may not always indicate of every condition within the Project, and clearing of existing debris or soils could uncover hazardous material contamination not previously known to occur on site. Therefore, potential impacts related to the presence of hazardous substances would be potentially significant.</u></p>		<p>62.7 to properly dispose of all on-site ACM's before general demolition activities commence.</p> <p>HM-2: Prior to demolition and any renovation activities on the Project Site, the Applicant shall submit verification to the City of Santa Paula Building and Safety Department that a lead-based paint survey has been conducted at all existing buildings located on the Project Site. If lead-based paint is found, the Applicant shall follow all OSHA procedural requirements and regulations for its proper removal and disposal before general demolition activities commence.</p> <p>HM-3: Prior to disposal, all fluorescent light fixtures within the existing buildings shall be inspected for PCB content labels throughout demolition of the Project Site.</p> <p>HM-4: Pole-mounted transformers, light ballasts, or other equipment suspected to contain PCBs must be inspected for the presence of PCBs prior to before any disturbance or removal. All equipment found to contain PCBs must be removed and disposed in accordance with all applicable local, State and Federal regulations including but not limited to California Code of Regulations Title 22, 40 CFR Part 261, and EPA 40 CFR. Utility Plans prepared as part of building permit review must include notes requiring inspection and plan for removal and disposal.</p> <p><u>HM-5: In the unlikely event that hazardous materials are encountered during grading or excavation activities anywhere on the Project Site, earthwork must be temporarily suspended in order to coordinate investigation/remediation efforts with the oversight of the Santa Paula Fire Department. An environmental professional (e.g. a professional geologist) is recommended to provide oversight and project monitoring to ensure the health and safety of all workers. A remedial plan consistent with federal and state remedial requirements, must be developed by a professional geologist approved by the City and submitted to the City Planning Director, or</u></p>	
--	--	--	--

		<u>designee, for approval as required before continued work in the area.</u>	
The Project Site has been historically used for agricultural uses for more than 75 years, it is possible that residual pesticides may be exposed during grading and excavation activities. The limited Phase II ESA conducted for the Project Site determined that exposure of residual pesticides is considered low. However, soil testing may not always indicate of every condition within the Project, and clearing of existing debris or soils could uncover hazardous material contamination not previously known to occur on site. Therefore, potential impacts related to the presence of hazardous substances would be potentially significant.	Potentially Significant	HM-5: In the unlikely event that hazardous materials are encountered during grading or excavation activities anywhere on the Project Site, earthwork must be temporarily suspended in order to coordinate investigation/remediation efforts with the oversight of the Santa Paula Fire Department. An environmental professional (e.g. a professional geologist) is recommended to provide oversight and project monitoring to ensure the health and safety of all workers. A remedial plan must be developed by a professional geologist approved by the City and submitted to the City Planning Director, or designee, for approval as required before continued work in the area.	Less than Significant

ES-49 Table ES-2, Summary of Project Impacts, Hazards and Hazardous Materials

The Project Site is not within 0.25 miles of an existing school. The Project would <u>may</u> involve the use of hazardous materials on site typical of industrial-type uses. The storage and disposal of these hazardous materials on the Project Site would comply with City and SPFD regulations and standards. Therefore, impacts would be less than significant.	Less than Significant	No mitigation necessary.	Less than Significant
--	-----------------------	--------------------------	-----------------------

ES-51 Table ES-2, Summary of Project Impacts, Hazards and Hazardous Materials

The Specific Plan area has the potential for residents and employees to encounter human-made and natural hazards, which could cause undue hardship to residents and employees.	Less than Significant	No mitigation necessary.	Less than Significant
--	-----------------------	--------------------------	-----------------------

<p>The working population within the Specific Plan would be made aware of such disaster plans through public education and outreach activities. In addition, the Project would comply with the SPFD’s recommended standards for emergency accessibility and circulation. Thus, the Project’s operational impacts on the implementation of the Ventura County Hazard Mitigation Plan would be considered less than significant.</p>			
--	--	--	--

ES-52 Table ES-2, Summary of Project Impacts, Hazards and Hazardous Materials

<p>Construction activities of the Project may require the closure of vehicle travel lanes. The City’s designated evacuation routes are along SR 126 and SR 150. While, SR 126 runs along the southern boundary of the Project Site, construction activities of the Project are not anticipated to interfere with access to the roadway or interfere with operation of the County’s Hazard Mitigation Plan. Emergency access and potential traffic access impacts would <u>be</u> less than significant.</p>	<p>Less than Significant</p>	<p>No mitigation necessary.</p>	<p>Less than Significant</p>
---	------------------------------	---------------------------------	------------------------------

ES-53 Table ES-2, Summary of Project Impacts, Hazards and Hazardous Materials

<p>The Specific Plan is <u>not</u> located not within a CAL FIRE designated LRA or SRA. As the Project would not expose employees or visitors to any increased risks to fire hazards on the site, impacts are considered to be less than significant.</p>	<p>Less than Significant</p>	<p>No mitigation necessary.</p>	<p>Less than Significant</p>
--	------------------------------	---------------------------------	------------------------------

ES-53 Table ES-2, Summary of Project Impacts, Cumulative Impacts, Hazards and Hazardous Materials

<p><u>Although each related project has potentially unique hazardous materials considerations, it is anticipated that all hazardous materials delivered and hazardous waste removed from the Specific Plan area and each related project would be in accordance with Title 24 of the Code of Federal Regulations. Development of any projects would be required to comply with existing applicable laws and regulations pertaining to hazardous wastes, and the risk with identified hazardous material sites would be eliminated or reduced. Businesses would also be required to prepare a HMBP including an annual inventory of hazardous materials used on site and submit a business emergency plan to the City for an annual review.</u></p> <p><u>Development under the Specific Plan would comply with all applicable laws and regulations related to the transport, use, treatment, storage, and disposal of hazardous materials and fire prevention.</u></p>	<p><u>Less than Significant</u></p>	<p><u>No mitigation necessary.</u></p>	<p><u>Less than Significant</u></p>
--	-------------------------------------	--	-------------------------------------

ES-54-55 Table ES-2, Summary of Project Impacts, Hydrology and Water Quality

<p>The development of the Project would increase the amount of impervious surfaces on the Project Site, which has the potential to increase runoff within the Project Site. The BMPs and the project design features would address the anticipated and expected pollutants of concern from operation of the Project. Degradation of water quality from the Project would be managed in accordance with all <u>existing</u> applicable federal, state, and</p>	<p>Less than Significant</p>	<p>No mitigation necessary.</p>	<p>Less than Significant</p>
---	------------------------------	---------------------------------	------------------------------

<p>local water quality rules and regulations to effectively minimize the Project’s impact on water quality. Accordingly, impacts would be less than significant.</p>			
<p>The Project will not result in a significant new demand for water and will not substantially deplete groundwater supplies. In addition, <u>the Project would use less water than the existing agricultural operations, and</u> the Specific Plan would incorporate design features such as bioswales, bioretention cells, infiltration trenches and permeable pavement to allow surface water runoff percolation. Therefore, the Specific Plan would not substantially interfere with groundwater recharge. There will be no substantial impact to local groundwater recharge. Therefore, impacts would be less than significant.</p>	<p>Less than Significant</p>	<p>No mitigation necessary.</p>	<p>Less than Significant</p>
<p><u>The Project does not alter the course of a stream or river, however</u> Site-clearing and grading operations have the potential for discharging sediment downstream during storm events. The Project would be required to develop a site-specific SWPPP in accordance with the NPDES Program General permits authorized under the Clean Water Act for Construction Activities. Adherence to the SWPPP and implementation of standard BMPs during construction would reduce the potential for increased siltation, erosion, and hazardous material spills. Through compliance with the SWPPP and standard BMPs, potential erosion and siltation, potential impacts will be less than significant.</p>	<p>Less than Significant</p>	<p>No mitigation necessary.</p>	<p>Less than Significant</p>

ES-56 Table ES-2, Summary of Project Impacts, Hydrology and Water Quality

<p>The Specific Plan would not substantially alter drainage patterns within the Project area, <u>nor alter a stream or river</u>. The storm drain system would collect on-site runoff and direct most of it to three separate detention basins prior to outletting into storm drains that connect to the existing culverts under SR 126. Peak flows would not exceed existing conditions, so there would not be adverse effects downstream. Therefore, impacts are considered less than significant.</p>	<p>Less than Significant</p>	<p>No mitigation necessary.</p>	<p>Less than Significant</p>
--	------------------------------	---------------------------------	------------------------------

ES-58-59 Table ES-2, Summary of Project Impacts, Cumulative Impacts, Hydrology and Water Quality

<p><u>The Project would not contribute to a cumulatively significant hydrology or water quality impact. First, the Project does not alter any streams or rivers. Second, each related project would be required to comply with NPDES requirements and local regulations designed to prevent polluted runoff from entering local storm drain systems and receiving water bodies during construction and after development, the cumulative impact to water quality would be less than significant. Implementation of applicable City requirements, including the standards of the Ventura County SQUIMP, on all new development within the watershed would reduce cumulative impacts to area hydrology to a less than significant level. Additionally, the Project will not substantially deplete groundwater supplies or interfere substantially with groundwater recharge such that there</u></p>	<p><u>Less than Significant</u></p>	<p><u>No mitigation necessary.</u></p>	<p><u>Less than Significant</u></p>
---	-------------------------------------	--	-------------------------------------

<u>would be a net deficit in aquifer volume of the local groundwater table level.</u>			
---	--	--	--

ES-60 Table ES-2, Summary of Project Impacts, Land Use

The Project would be consistent with the County of Ventura General Plan and Non-Coastal Zoning Ordinance, the Santa Paula General Plan and SPMC, the 2016 SCAG RTP/SCS, and with Ventura LAFCo <u>policies</u> . Therefore, the project would not conflict with any applicable land use plan, policy, or regulation of an agency with jurisdiction over the project and impacts would be less than significant.	Less than Significant	No mitigation necessary.	Less than Significant
---	-----------------------	--------------------------	-----------------------

ES-60 Table ES-2, Summary of Project Impacts, Cumulative Impacts, Land Use

<u>No significant cumulative land use impacts from future development within the expansion areas would result as these areas will be developed in accordance with the City's General Plan. Additionally, environmental review will also be required and will be conducted prior to the adoption of future Specific Plans.</u>	<u>Less than Significant</u>	<u>No mitigation necessary.</u>	<u>Less than Significant</u>
---	------------------------------	---------------------------------	------------------------------

ES-61 Table ES-2, Summary of Project Impacts, Noise

An increase of 3 dB(A) or greater in traffic noise levels that occurs from Project-related activities would be considered significant if the resulting noise levels that occurs from Project-related activities would exceed the City Noise	Less than Significant	No mitigation necessary.	Less than Significant
---	-----------------------	--------------------------	-----------------------

<p>Compatibility Matrix for “acceptable” exterior or interior noise levels. These roadway systems <u>will</u> do not experience an increase in noise levels of 3 dB(A) or greater. In addition, vehicle trips and traffic noise levels would remain the same with the proposed Beckwith Road extension and would not cause an increase of 3 dB(A) or greater due to Project-related activities. Therefore, the Santa Paula West Specific Plan Area would not result in <u>significant</u> noise impacts in the local and regional street system. Impacts along these roadway systems are considered less than significant.</p>			
---	--	--	--

ES-62 Table ES-2, Summary of Project Impacts, Noise

<p>Assuming noise levels at 69.4 dB(A) within 50 feet from the railway centerline, interior noise <u>will</u> could be reduced to 44.4 dB(A), below the General Plan noise threshold of 45 dB(A), <u>in compliance with City Building Code requirements</u>. Therefore, potential interior noise within the proposed development would be considered less than significant.</p>	<p>Less than Significant</p>	<p>No mitigation necessary.</p>	<p>Less than Significant</p>
--	------------------------------	---------------------------------	------------------------------

ES-62 Table ES-2, Summary of Project Impacts, Noise

<p>The surrounding land uses within 25 feet of the Project Site include the scattered residential uses immediately to the west. The construction near this portion of this site may include some earthwork and grading activities. While offsite surrounding land uses may experience vibration events, these would <u>be temporary and would</u> not be frequent and</p>	<p>Less than Significant</p>	<p>No mitigation necessary.</p>	<p>Less than Significant</p>
---	------------------------------	---------------------------------	------------------------------

impacts would be considered less than significant.			
--	--	--	--

ES-63 Table ES-2, Summary of Project Impacts, Noise

<p>Average daily trips associated with construction activities would not result in a doubling of trip volume along study area roadways. Given that it takes a doubling of average daily trips on roadways to increase noise by 3 dB(A), <u>The average daily trips associated with construction activities would not result in a doubling of trip volume along study area roadways.</u> Noise-level increases associated with construction vehicle trips along major arterials in the City of Santa Paula and nearby roadways that are within the area (unincorporated County of Ventura) would be less than 3 dB(A), and potential impacts will be less than significant.</p>	Less than Significant	No mitigation necessary.	Less than Significant
---	-----------------------	--------------------------	-----------------------

ES-65 Table ES-2, Summary of Project Impacts, Public Services

<p>The Specific Plan will result in an increase in the need for services from existing Santa Paula Fire Department facilities, equipment, and staff personnel. Under the terms of the Development Agreement, the Project Applicant and/or developer will be required to contribute funding through development impact fees to the City to contribute toward ongoing fire protection facilities and personnel costs. No new facilities would be required to serve the Project Site as a result</p>	Less than Significant	No mitigation necessary.	Less than Significant
--	-----------------------	--------------------------	-----------------------

<p>of the implementation of the Specific Plan. As such, mitigation is not required.</p> <p>¶The SPFD will review all future building plans and require adequate fire-flow pressure and flow rates through automatic fire sprinkler systems, fire hydrants, and other design features where appropriate (as required by appropriate federal, state, and local fire code and building code requirements. As such, potential impacts with regard to fire-flow requirements will be less than significant.</p>			
--	--	--	--

ES-67 Table ES-2, Summary of Project Impacts, Cumulative Impacts, Public Services

<p><u>The City has regulations and ordinances in place to address impacts on public services (e.g., police, fire), including the provision and acquisition of new facilities and equipment. All planned development would be reviewed by the respective agencies and corresponding mitigation design features and payment of existing fees would be required prior to building permit issuance. Therefore, cumulative impacts associated with public services would be less than significant.</u></p>	<p><u>Less than Significant</u></p>	<p><u>No mitigation necessary.</u></p>	<p><u>Less than Significant</u></p>
---	-------------------------------------	--	-------------------------------------

ES-68 Table ES-2, Summary of Project Impacts, Transportation and Traffic

<p>If Beckwith Road is extended south to Faulkner Road, 10th Street and Harvard Boulevard intersection is forecast to operate at LOS D during the AM peak hour. The City of Santa Paula has defined the minimum desirable intersection level of service as LOS C, traffic generated by the proposed project would</p>	<p><u>Potentially Significant</u></p>	<p>10th Street & Harvard Boulevard (Intersection 1) <u>No feasible</u> m<u>Mitigation measures are available from prior major projects in Santa Paula were investigated along the Ojai Road corridor.</u> A beautification project, including bicycle lanes, is planned along 10th Street at this location; therefore, widening of 10th Street to gain capacity was not considered as a possible <u>physically feasible</u> mitigation. Given the constraints of the intersection and the</p>	<p>Significant and Unavoidable</p>
--	---------------------------------------	---	------------------------------------

<p>cause or contribute to significant traffic impacts at this intersection.</p>		<p>proposed bicycle lanes, <u>cumulative impacts to</u> this intersection cannot be fully mitigated, and the impact would remain significant and unavoidable. Alternatively, a peak parking restriction on the southbound approach would allow for the reconfiguration of the southbound approach to include one shared through/right-turn lane, one through lane (during peak hours), and one left-turn lane. The northbound approach could be restriped to provide one right-turn lane, one through lane, and one left-turn lane. In combination, these measures would result in an improvement from LOS C during the AM peak hour and LOS D during the PM peak hour to LOS A during the AM peak hour and LOS B during the PM peak hour, thus mitigating the increase in V/C ratio attributable to project traffic. However, due to the planned bicycle lanes, these <u>improvements</u> mitigations were not considered <u>to be</u> as a feasible mitigation <u>measure</u>.</p>	
---	--	---	--

ES-68 Table ES-2, Summary of Project Impacts, Transportation and Traffic

<p>If Beckwith Road is extended south to Faulkner Road, Peck Road and Harvard Boulevard/Telegraph Road/Main Street is forecast to operate at LOS D during the AM Peak hour. The City of Santa Paula has defined the minimum desirable intersection level of service as LOS C, traffic generated by the proposed project would cause or contribute to significant traffic impacts at this intersection.</p>	<p>Potentially Significant</p>	<p>TRA-1 Peck Road & Harvard Boulevard/Telegraph Road/Main Street (Intersection 8).This intersection could be mitigated to LOS C or better with the addition of one travel lane to both the northbound and southbound approaches on Peck Road and the addition of a northbound right overlap phase. The northbound lane configuration would be one right-turn lane, two through lanes, and one left-turn lane. The northbound right-turn movement would also have an overlap signal head installed to accommodate the overlap phase. The southbound lane configuration would be one shared through/right-turn lane, one through lane, and one left-turn lane.</p> <p>Since this is a cumulative impact, the Project applicant would <u>shall</u> be responsible for their fair share contribution for this mitigation improvement.</p>	<p>Less than Significant</p>
--	--------------------------------	--	------------------------------

ES-69 Table ES-2, Summary of Project Impacts, Transportation and Traffic

<p>If Beckwith Road is not extended south to Faulkner Road, Peck Road and Harvard Boulevard/Telegraph Road/Main Street would operate at LOS <u>D</u> during the AM Peak hour. The City of Santa Paula has defined the minimum desirable intersection level of service as LOS C, traffic generated by the proposed project would cause or contribute to significant traffic impacts at this intersection.</p>	<p>Potentially Significant</p>	<p>Implementation of mitigation measure TRA-1.</p>	<p>Less than Significant</p>
--	--------------------------------	---	------------------------------

ES-70 Table ES-2, Summary of Project Impacts, Transportation and Traffic

<p>The freeway segments currently operate at LOS C or better in both directions. Based on the significance threshold for the Los Angeles County CMP, the Project will <u>does</u> not operate at LOS F after the addition of project traffic and the Project does not cause a net increase in traffic demand of 2 percent of capacity or more. Therefore, the Project would result in less than significant impacts to freeway and multilane segments.</p>	<p>Less than Significant</p>	<p>No mitigation necessary.</p>	<p>Less than Significant</p>
---	------------------------------	---------------------------------	------------------------------

ES-72 Table ES-2, Summary of Project Impacts, Transportation and Traffic

<p>Under future conditions without the Project, 10th Street and Harvard Boulevard is expected to operate at LOS E during the AM Peak hour and LOS F during the PM Peak hour. The City of Santa Paula has defined the minimum desirable intersection level of service as LOS C. Traffic generated from future conditions without the Project would</p>	<p>Potentially Significant</p>	<p>10th Street & Harvard Boulevard (Intersection 1) <u>No feasible</u> mMitigation measures <u>are available from prior major projects in Santa Paula were investigated along the Ojai Road corridor.</u> A beautification project, including bicycle lanes, is planned along 10th Street at this location; therefore, widening of 10th Street to gain capacity was not considered as a possible <u>physically feasible</u> mitigation. Given the constraints of the intersection and the proposed bicycle lanes, <u>cumulative impacts to this intersection</u></p>	<p>Significant and Unavoidable</p>
---	--------------------------------	---	------------------------------------

<p>cause or contribute to significant traffic impacts at this intersection.</p>		<p>cannot be fully mitigated, and the impact would remain significant and unavoidable. Alternatively, a peak parking restriction on the southbound approach would allow for the reconfiguration of the southbound approach to include one shared through/right-turn lane, one through lane (during peak hours), and one left-turn lane. The northbound approach could be restriped to provide one right-turn lane, one through lane, and one left-turn lane. In combination, these measures would result in an improvement from LOS C during the AM peak hour and LOS D during the PM peak hour to LOS A during the AM peak hour and LOS B during the PM peak hour, thus mitigating the increase in V/C ratio attributable to project traffic. However, due to the planned bicycle lanes, these <u>improvements mitigations</u> were not considered <u>to be</u> as a feasible mitigation <u>measure</u>.</p>	
---	--	---	--

ES-73 Table ES-2, Summary of Project Impacts, Transportation and Traffic

<p>Under future conditions without the Project, Peck Road and Harvard Boulevard/Telegraph Road/Main Street is expected to operate at LOS E during the AM Peak hour. The City of Santa Paula has defined the minimum desirable intersection level of service as LOS C. Traffic generated from future conditions without the Project would cause or contribute to significant traffic impacts at this intersection.</p>	<p>Potentially Significant</p>	<p>Implementation of mitigation measure TRA-1. This intersection could be mitigated to LOS D with the same mitigation measure suggested for the Existing plus Project scenario. Full mitigation of this intersection under Cumulative plus Project conditions requires the addition of a second left-turn lane to the westbound approach on Main Street. The westbound approach on Main Street would have to be reconfigured to include one right-turn lane and dual left-turn lanes and maintain the exclusive or protected signal phasing for this turning movement. However, the implementation of dual left-turns at this location would require the acquisition of right-of-way on Main Street and relocation of existing grade crossing gates to accommodate the proposed intersection configuration, and so was not considered as a feasible mitigation.</p>	<p>Significant and Unavoidable</p>
---	--------------------------------	---	------------------------------------

ES-74 Table ES-2, Summary of Project Impacts, Transportation and Traffic

<p>Under future conditions without the Project, Peck Road and SR 126 EB On/Off Ramps/ Acacia Way is expected to operate at LOS F during the PM Peak hour. The City of Santa Paula has defined the minimum desirable intersection level of service as LOS C. Traffic generated from future conditions <u>with or</u> without the Project would cause or contribute to significant traffic impacts at this intersection.</p>	<p>Potentially Significant</p>	<p>Implementation of mitigation measure TRA-2.</p>	<p>Less than Significant</p>
--	--------------------------------	---	------------------------------

ES-74 Table ES-2, Summary of Project Impacts, Transportation and Traffic

<p>Under future conditions without the Project, Faulkner Road and SR 126 WB On/Off Ramps is expected to operate at LOS F during the AM Peak hour. Section 2.0, Project Description

Page

Revision:

2.0-1

Project Objectives

1. Help revitalize the existing built environment and economic climate of the City by permitting new investment and development in West Area 2 that reflects and complements the existing pattern and scale of development in Santa Paula, as envisioned in the City's General Plan;

2.0-27

Conceptual Grading Master Plan

The Specific Plan includes a Grading Master Plan for the earthwork needed to support development of the Project. The Grading Master Plan is shown in **Figure 2.0-14, Grading and Drainage Master Plan**. The Grading Master Plan provides for the cut and fill grading of the Project Site into a roughly 2 percent land gradient overall, which would maintain the existing gradient from north to south. Cut and fill grading will be conducted using on-site soils with an overexcavation and recompaction depth of approximately 6 feet. Grading will also raise portions of the Project Site above the flood hazard elevation, with up to 6 feet of fill to be placed along the western boundary near Adams Barranca. Grading over the Project Site includes an estimated 80,000 cubic yards of cut and 179,000 cubic yards of fill, requiring the import of approximately 99,000 cubic yards of soil. The finished grade of the Project Site will maintain the existing 2 percent maximum gradient, and yield roadways and blocks in the lower areas generally within the 0.5 percent to 2 percent gradient range.

2.0-28

General Plan Amendment, Rezone, and Annexation

The Project would implement the City's plans for a portion of the West Area 2 Planning Area as defined in the Santa Paula General Plan. The Project includes a series of related actions including ~~jurisdictional reorganization (annexation)~~, a General Plan Amendment (to the Land Use Element), ~~and the adoption of a Specific Plan and rezoning for the Project area,~~ approval of a Master Vesting Tentative Map, jurisdictional reorganization (annexation to the City of Santa Paula), encroachment permit by the California Department of Transportation for the construction of roadway and utility improvements in the State right-of-way

and California Public Utilities Commission approval for an at-grade crossing of the Ventura County Transportation Commission (VCTC) railroad.

2.0-31

Development Timeframe

Initial land development including, site clearing, grading, roadway construction, and improvements of the Project Site are anticipated to occur over an approximately 4-month period starting sometime in 2019. For purposes of the analysis within this Environmental Impact Report (EIR), construction of individual buildings is assumed to occur over approximately 10 years in response to market conditions. ~~Development of the Project is anticipated to occur over approximately 10 years or as market conditions allow. For purposes of the analysis within this Environmental Impact Report (EIR), development is expected to begin in 2017 and be completed by 2027. Construction would occur continuously during this 10-year period but would generally occur based on market and economic conditions to provide for orderly development.~~

2.0-31

City of Santa Paula

The City of Santa Paula, as Lead Agency, will require the following approvals, permits, and actions to implement the proposed ~~East Gateway Project~~ Santa Paula West Specific Plan Project:

General Plan Amendment for the West Area 2 Expansion Area;

Specific Plan Approval and rezoning;

~~Development Agreement~~

Approval of the Master Vesting Tentative Map;

Annexation to the City of Santa Paula;

Encroachment permit by the California Department of Transportation for the construction of roadway and utility improvements in the State right-of-way; and

California Public Utilities Commission approval for an at-grade crossing of the Ventura County Transportation Commission (VCTC) railroad.

Section 3.0, Related Projects

3.0-1 Related Projects

An estimated total of 1,770~~81~~ residential units and 1,077,021 ~~1,022,772~~ square feet of commercial and industrial facilities and 16 motel units (not including this Project) is pending, approved, under construction, or built. In addition, a total of 7,657 acres of expansion area is proposed for annexation into the City's boundaries.

Section 4.1, Aesthetics

Page

Revision:

4.1-12

Scenic Highways

The County of Ventura General Plan identifies SR 126 as an eligible county scenic highway.¹ The City of Santa Paula's General Plan Conservation and Open Space Element identifies SR 126 and SR 150 as man-made scenic resources.² SR 126 offers sweeping 360-degree views of the higher elevations of the surrounding mountains from throughout the travel corridor. Views include portions of the Topatopa Mountains and Santa Paula Peak to the north, and the South Mountain to the south. Where openings in landscaping or structural development along the right-of-way occur, wide-ranging views of agricultural lands are also available along the corridor, predominantly occurring outside the City's limits. As described previously, parts of the Project Site are blocked by existing vegetation; however, gaps in the vegetation allow the Project Site to enter public view along SR 126. a majority of the Project Site is visible from SR 126. This is due to the minimal landscaping, vegetation, and power lines that would obstruct views when seen from a moving vehicle.

4.1-16–4.1-17

Project Impacts

4.1.4 PROJECT IMPACTS

Threshold: Have a substantial adverse effect on a scenic vista?

Temporary Construction Impacts

Construction activities within the Project Site and off-site improvements, such as along Beckwith Road and Faulkner Road, could potentially be visible from SR 126 and Telegraph Road and other vantage points that currently have views of these areas. Additionally, there would be off-site improvements along SR 126 for the connection of Beckwith Road to the extended Faulkner Road. Initial land development, including site clearing, grading, roadway construction, and improvements of the Project Site are anticipated to occur over an approximately 4-month period starting in sometime in 2019. For purposes of the analysis within this EIR, construction of individual buildings is assumed to occur over

1 County of Ventura, *General Plan*, "Resources Appendix," (2011).

2 City of Santa Paula, *General Plan*, "Conservation and Open Space Element," (1998).

~~approximately 10 years in response to market conditions. Development of the Specific Plan would occur over a 10-year period or as market conditions allow. Construction activities would include various site preparation, vegetation removal, and grading activities.~~ As the Project Site is relatively flat and is at relatively low elevation, grading activities would include the import of approximately 99,000 cubic yards of soil to raise portions of the western areas above flood elevations from Adams Barranca flows. Finished grades not substantially also the existing be contours and would result in slightly reduced differences in elevations over the Project Site. The infrastructure improvements, such as water and sewer pipelines, and roadways would be constructed to meet the needs of the development as it progresses over time.

~~**Threshold: Have a substantial adverse effect on a scenic vista?**~~

Operational Impacts

4.1-17-4.1-18

Project Impacts

Development in accordance with the Specific Plan would result in an expanded urban fringe on the westerly limits. The Project would provide for the development of commercial and light industrial uses, along with roadways and open space across the 53.8-acre Project Site. Building heights would be consistent with the 1- to 2-story buildings having similar uses to the east of the Project Site, with a maximum building height of 35 feet and 45 feet for commercial/light industrial and industrial uses, respectively.

The more panoramic vistas that take in a sweeping breadth of the mountains and foothills forming the river valley and vistas overlooking the lower man-made and natural horizon features of the area would not be blocked through development under the Specific Plan. Rather, more immediate foreground and middle-distant open views across the Project Site would be replaced with structures. Landscaping within the Project Site could channel some views from the immediate surroundings. However, as previously stated, this development would not add an anomalous element to the viewshed because it would occur on the urban fringe of the City near existing light industrial and residential areas.

While implementation of the Project would result in the loss of views of the existing agricultural lands in the immediate foreground with the addition of

structures, circulation system, and supporting infrastructure, the urbanized appearance is similar to the adjacent uses, and in More distant scenic vistas views of the Santa Clara River Valley would not be significantly altered upon the development of structures on the Project Site. Therefore, the Project would result in less than significant adverse impacts to scenic vistas.

4.1-22 Mitigation Measures

The following mitigation measure would reduce the Project’s potentially significant impacts related to nighttime lighting to less than significant:

AES-1: Before the City issues grading permits, the applicant must prepare and submit a Lighting Plan to the City of Santa Paula Planning Director for approval that identifies the types of shielding that will be used for outside lighting and must comply with all applicable dark sky ordinances/regulations.

Section 4.2, Agricultural Resources

Page Revision:

4.2-17-18 Project Impacts

The City of Santa Paula follows the CDC’s FMMP in identifying the conversion of state-defined prime soils and soils of statewide importance as an impact to agricultural resources. The FMMP Important Farmland Map for Ventura County identifies a total of 44.229 acres of prime farmland and 4.88 acres of farmland of statewide importance on the site (total of 49.108 acres). The Project Site is currently farmed by two organizations, Bender Farms and McGrath Farms. Bender Farms grows avocados on approximately 9.2 acres of land, and herbs on approximately 12.3 acres. McGrath Farms grows a variety of row crops on approximately 27.5 acres of land. Other areas contain the agricultural ancillary uses, such as packing facilities and equipment storage and maintenance yards, and are designated as developed.

Approximately 4.71 acres of land located within the current agricultural operation near Beckwith Road contains a farmworker housing unit and has thus been developed for uses other than agricultural. Further, this area of land does not meet any of the criteria identified in Government Code Section 56064. Therefore,

49.1 acres (53.81 acres–49.1 acres) of the Project Site would be considered Prime Agricultural Land under Government Code Section 56064.

Implementation of the Specific Plan would result in the conversion of the 49.1~~08~~ acres of both prime farmland and important farmland to urbanized uses and the conversion of 49.1 acres of Prime Agricultural Land, as defined in Government Code Section 56064.

With implementation of **Mitigation Measure AG-1**, the Applicant shall provide mitigation to the extent feasible, to minimize or reduce the level of impacts to farmland. However, ~~T~~the loss of 49.1~~08~~ acres of farmlands is considered a significant and unavoidable impact.

4.2-19

Project Impacts

As stated previously, approximately 49 acres of the 54-acre Project Site are under agricultural cultivation and would be taken out of production as a result of implementation of the Specific Plan. This includes approximately 9.2 acres of avocados, 12.3 acres of herbs, and 27.5 acres of other miscellaneous row crops. These areas would be developed with an office/industrial/business park that includes a variety of manufacturing, research and development, professional office, and limited commercial uses. Development under the Specific Plan would result in the loss of 49 acres of land currently under agricultural cultivation, of which 44 acres consists of prime farmland, and approximately 5 acres consists of farmland of statewide importance. **Mitigation Measure AG-1** would be implemented; however, ~~T~~this farmland conversion is considered a significant and unavoidable impact.

4.2-20

Adjacent Agriculture

As stated previously, existing agricultural lands producing avocados, citrus fruits, and a variety of row crops are located south of the Specific Plan area, south of State Route (SR) 126, and near the western boundary of the Specific Plan area, west of Adams Barranca. Agricultural operations to the south are separated from the Project Site by SR 126. SR 126 includes a transportation corridor that is approximately 160 feet wide and is raised above the existing grades of the Project Site and agricultural land to the south. There is no land use connectivity between the Project Site and these agricultural lands. Furthermore, portions of the

agricultural lands south of SR 126 are also within the City's CURB and the West Area 2 Expansion area, which would allow for future planning for similar light industrial uses as would occur under the Santa Paula West Specific Plan.

4.2-21–4.2-23

Cumulative Impacts

Implementation of the Project would reduce avocado, herb, and row crop production locally and within the County. The loss of approximately 49.108 acres would represent a fraction of a percent of the 93,376 acres of agricultural land harvested in the County in 2014. Of the 23,012 acres of avocado and cilantro harvested in the County in 2014, the Project would represent approximately 0.210 percent. However, the Project would contribute to the conversion of agricultural lands in the County to nonagricultural uses.

Implementation of the General Plan would result in a long-term commitment to nonagricultural uses in areas that currently support prime and important Farmland, particularly within the West Area 2 and East Area 2 Expansion Areas. Since both of these expansion areas include statewide important farmland, development of these areas in accordance with the General Plan will result in cumulative impacts to agricultural resources within the City's Planning Area. While development of these areas would be consistent with local planning policies, the cumulative impact on agricultural resources would be a significant and unavoidable impact.

~~Implementation of the General Plan would result in a long-term commitment to nonagricultural uses in areas that currently support prime soils, particularly within the flatland expansion areas (West Area 2 and East Area 2). Since development of proposed land uses within the expansion areas would occur over most prime and statewide important farmland, it is assumed that all prime soils within these areas could be impacted or rendered infeasible for further agricultural production. Implementation of **Mitigation Measure AG-1** would help to minimize impacts to farmland, however, the loss of high-quality agricultural soils, while only a small percentage of the total prime and statewide importance agricultural land in Ventura County, is considered both individually and cumulatively significant.~~

4.2-21

Mitigation Measures

AG-1: To reduce or minimize impacts to Prime Farmland, and Important Farmland, the Applicant shall provide mitigation through one, or some combination of, the following mitigation measures, prior to the issuance of a grading permit by the City:

1. The Applicant shall secure a conservation easement in perpetuity, on land officially designated by the State of California as Prime Farmland and Important Farmland. The mitigation ratio shall be 1:1 for each class of designated farmland, resulting in a conservation easement being placed on a total of 44.20 acres of Prime Farmland, and 4.88 acres of Important Farmland, within the State of California. The applicant may satisfy the Important Farmland mitigation requirement by conserving Prime Farmland; or
2. The Applicant shall make payments to a local, regional, or statewide organization whose purpose is to acquire agricultural conservation easements for Prime Farmland and Important Farmland, and has demonstrated a successful track record in doing so, over at least 5 years. If the applicant elects to pursue this option alone, or in combination with option 1, the Applicant shall demonstrate to the City Planning Director that it has paid funds sufficient to allow the state, regional, or local conservation organization to acquire conservation easements in perpetuity over Prime Farmland and important Farmland resulting in a mitigation conservation ratio or 1:1 for each class of Farmland.

If, prior to the issuance of a grading permit, the Applicant contends that satisfying mitigation options 1 and/or 2 is not financially feasible, the Applicant shall provide “substantial evidence” to the City Planning Director, as that term is defined in the CEQA Guidelines, including but not limited to expert opinion evidence supported by facts, to support its contention that such mitigation is not financially feasible. The Applicant’s substantial evidence shall be independently reviewed by the City’s financial experts or outside consultant, the

cost of which shall be paid by the Applicant. If the City concurs with the Applicant's conclusion that mitigation options 1 and/or 2 are not financially feasible, the Applicant shall provide mitigation at less than a 1:1 ratio, to the extent feasible, to minimize or reduce the level of impacts to Prime Farmlands and important Farmlands.

~~The City of Santa Paula does not propose to require implementation of agricultural mitigation for projects within the Santa Paula West Business Park Area. This determination is made based on the following reasons:~~

~~1. The City of Santa Paula recognized the loss of this agricultural land with the designation of the site for development in the General Plan. The Project Site is identified in the General Plan as a part of the West Area 2 Expansion Area. The City's General Plan Land Use Element currently designates the Project Site for Mixed-Use Commercial/Light Industrial uses.~~

~~The preservation of other existing agricultural land through purchase of conservation easements does not mitigate the loss of the land in question. The only way to mitigate the loss would be to preserve the land in question by preventing development.~~

~~The City has neither an established program under which agricultural mitigation fees could be collected and dispersed nor any policy to require such a program.~~

~~The cost of such agricultural mitigation is not considered economically feasible. This impact has been found to be significant and unavoidable, and a statement of overriding considerations will be adopted for approval of the Project.~~

4.3-6

Air Pollutants

Ambient air quality is determined by the type and amount of pollutants emitted into the atmosphere, as well as the size, topography, and meteorological conditions of a geographic area. The South Central Coast Air Basin (“Basin”) has low mixing heights and light winds, which help to accumulate air pollutants. The average daily emissions inventory for the entire Basin and the Ventura County portion of the Basin is summarized in **Table 4.3-4, Regional Average Emissions in 2012-2015**. As shown, exhaust emissions from mobile sources generate the majority of ROG, oxides and nitrogen (NOx), and CO in Ventura County. Area-wide sources generate the most airborne particulates (i.e., PM10 and PM2.5).

4.3-7 Existing Local Air Quality

The Ventura County Air Pollution Control District (VCAPCD) monitors ambient air pollutant concentrations through a series of monitoring stations located throughout the County. These stations are located in Thousand Oaks, El Rio, ~~San Buenaventura (two stations)~~, Piru, Ojai, Simi Valley (two stations), and ~~on Anacapa Island-Thousand Oaks~~. In addition, the CARB operated a monitoring station in western Ventura County. The City of Santa Paula is located between El Rio and Piru monitoring stations. The El Rio station measures ambient concentrations of O3, PM10, PM2.5, and NO2. Ambient concentrations of ozone and PM2.5 are measured at the Piru station.

Table 4.3-5, Local Ambient Air Quality—El Rio and Piru Monitoring Stations, identifies the national and state ambient air quality standards for relevant air pollutants along with the ambient pollutant concentrations that have been measured at the El Rio and Piru monitoring stations during the period ~~2012-2014~~ through 2014-2016, which the most recent data available from CARB.

Notes: $\mu\text{g}/\text{m}^3$ = micrograms per cubic meter of air; ppm = parts per million by volume of air.

El Rio station measures ambient concentrations of O3, PM10, PM2.5, and NOx. Piru station measures ambient concentrations of O3 and PM2.5.

*Insufficient data available to determine the value.

4.3-12-13

Air Quality Management Plan

The VCAPCD is the agency principally responsible for comprehensive air pollution control in the Basin. As a regional agency, the VCAPCD works directly with SCAG, County transportation commissions, and local governments and cooperates actively with all federal and State government agencies. The VCAPCD develops rules and regulations to reduce emissions, protect public health and agriculture, and achieve and maintain State and federal air quality standards. In addition, the VCAPCD establishes permitting requirements for stationary sources, inspects emissions sources, and enforces such measures through educational programs or fines when necessary.

The VCAPCD is directly responsible for reducing emissions from stationary, area, and mobile sources. It has responded to this requirement by preparing a sequence of AQMPs. The most recent of these was the 2016 Ventura County Air Quality Management Plan ("2016 AQMP") adopted by the Governing Board of

the VCAPCD in February 2017.³ The 2016 AQMP is based on growth projections for Ventura County and subareas within the County that have been agreed to by both the County and the SCAG. As such, the 2016 AQMP presents Ventura County's (1) strategy to attain the 2008 federal 8-hour ozone standard; (2) attainment demonstration for the federal 8-hour ozone standard; and (3) reasonable further progress demonstration for the federal 8-hour ozone standard.

~~The VCAPCD is directly responsible for reducing emissions from stationary (area and point), mobile, and indirect sources. It has responded to this requirement by preparing a series of AQMPs. The most recent of these was adopted by the Governing Board of the VCAPCD in 2008. This AQMP, referred to as the 2007 AQMP, was prepared to comply with the federal and State Clean Air Acts and amendments, to accommodate growth, to reduce the high pollutant levels of pollutants in the Basin, to meet federal and state air quality standards, and to minimize the fiscal impact that pollution control measures have on the local economy. It identifies the control measures that will be implemented to reduce major sources of pollutants. These planning efforts have substantially decreased the population's exposure to unhealthy levels of pollutants, even while substantial population growth has occurred within the County.~~

~~The future air quality levels projected in the 2007 AQMP are based on several assumptions. For example, the VCAPCD assumes that general new development within the County will occur in accordance with population growth and transportation projections identified by County staff.~~

4.3-19

Project Impacts

According to the VCAPCD Guidelines, to be consistent with the AQMP, a project must conform to the local general plan and must no result in or contribute to an exceedance of the County's projected population growth forecast.

~~The 2007 AQMP, discussed previously, was prepared to reduce the high levels of pollutants within Ventura County, return clean air to the region, and minimize the impact on the economy. Projects that are considered consistent with the AQMP~~

3 Ventura County Air Pollution Control District, *Final 2016 Ventura County Air Quality Management Plan* (adopted February 14, 2017), <http://www.vcapcd.org/pubs/Planning/AQMP/2016/Final/Final-2016-Ventura-County-AQMP.pdf>.

would not interfere with attainment because there were included in the projections utilized in the formulation of the AQMP.

~~According to the VCAPCD Guidelines, to be consistent with the AQMP, a project must conform to the local general plan and must not result in or contribute to an exceedance of the City's projected population growth forecast. The proposed Project does not include any new residential uses and would not result in the direct growth of population within the Santa Paula Growth Area.~~

The VCAPCD's AQMP considers regional population forecasts developed by the Southern California Association of Governments (SCAG). SCAG's most recent population forecast was adopted in 2016 as part of the *2016–2040 Regional Transportation Plan/Sustainable Communities Strategy*. The 2016 SCAG growth forecast projects a SCAG's population projection increase from 29,800 in 2012 to 38,800 by year 2040, and employment increase 7,800 jobs in 2012 to 11,700 jobs by the year 2040.⁴ The proposed Project will not increase the amount of housing within the Specific Plan area because no residences are planned to be built. The project employment increase would be approximately 1,510 employees⁵ or approximately 12.9 percent of SCAG's projected employment growth by the year 2040 of 11,700 employees. For analysis purposes, the Project would indirectly increase the local population if all 1,510 employees relocated to the City of Santa Paula; however, they would account for 17 percent of the projected growth in population. This is a conservative estimate as employees may already live in the area, or may reside in other cities. Given that employment opportunities within the City are supposed to steadily increase through the year 2040, the Project's addition of 1,510 employees would be consistent with the projections per SCAG.

The planned uses would also be consistent with the City's land use and zoning designation of the Project site. The Project would accommodate a mix of commercial and light industrial uses within walking distance which would reduce the need for residents within the City to travel long distances to other commercial and entertainment centers. As such, the Project would not conflict with the 2016 AQMP and, as such, would not jeopardize attainment of state and national ambient air quality standards in Ventura County. Therefore, impacts regarding consistency with applicable air quality are considered less than significant.

4 Southern California Association of Governments, *2012–2035 Regional Transportation Plan/Sustainable Communities Strategy*, April 2016.

5 US Green Building Council, *Building Area Per Employee by Business Type*, May 13, 2008, <http://www.usgbc.org/Docs/Archive/General/Docs4111.pdf>, accessed August 24, 2016.

nd would not result in SCAG projections being exceeded. Therefore, as growth under the Specific Plan is not expected, the Project would not conflict with the 2007 AQMP and, as such, would not jeopardize attainment of state and national ambient air quality standards in Ventura County. Therefore, impacts regarding consistency with applicable air quality are considered less than significant.

4.3-21 Project Impacts, Table 4.3-6, Construction Emissions

Year 2020						
Unmitigated Maximum	235.18	17.01	18.61	0.64	1.55	1.04
VCAPCD threshold	25	25	—	—	—	—
Threshold Exceeded?	Yes	No	—	—	—	—
Mitigated Maximum	234.09	12.66	21.16	0.03	1.31	0.86
Threshold Exceeded?	Yes	No	—	—	—	—

Source: Refer to Air Quality and Greenhouse Gas Modeling data sheets in **Appendix 4.3**.

Notes: CO = carbon monoxide; NOx = nitrogen oxide; PM10 = particulate matter less than 10 microns; PM2.5 = particulate matter less than 2.5 microns; ROG = reactive organic gas; SOX = sulfur oxide.

As shown in **Table 4.3-6**, construction activities associated with the construction of uses allowed with the Specific Plan would exceed VCAPCD threshold for ROG and NOx throughout the entire construction period. Emissions of ROG are a precursor for the formation of O3. The primary source of ROG emissions is off-gas emissions associated with architectural coating operations. The primary source of NOx, CO, and SOx emissions is from construction equipment exhaust and on-road haul truck trips while the majority of particulate matter emissions would occur as a result of fugitive dust emissions generated during grading and excavation activities. Primary sources of PM10 and PM2.5 emissions would be clearing activities, excavation and grading operations, construction vehicle traffic on unpaved ground, and wind blowing over exposed earth surfaces.

Since construction of the Project will exceed the thresholds for ROG and NOx, these impacts are considered potentially significant.

Worst Case Construction Emission

The construction emissions analysis was conducted for Year 2020, which was identified as the worst-case year due to the overlapping construction activities of paving and architectural coating. Results of the construction emissions modeling analysis are presented in **Table 4.3-7, Worst-Case Construction Emissions (2020)**. ROG emissions from architectural coating exceeded the significance threshold.

4.3-22 Project Impacts, Worst Case Scenario

As discussed above, the VCAPCD's 25 lb/day threshold for ROG and NOx does not apply to construction emissions because such emissions are temporary. Emissions of TACs are localized, not regional, in nature; impacts related to construction activities would be limited to the area immediately surrounding the construction site within the Project area, and the VCAPCD does not recommend any thresholds of significance for their associated emissions. Instead, the VCAPCD bases the determination of significance on a consideration of the control measures to be implemented. If all appropriate emissions control measures recommended by the VCAPCD Guidelines are implemented for a project, then construction emissions are not considered significant. Implementation of mitigation measure AQ-1 through AQ-5 include dust control measures, such as watering graded areas, covering trucks hauling excavated soil, soil stabilization methods, and street sweeping; and construction equipment controls such as minimizing idle time, maintaining equipment engines, using alternatively fueled equipment, and minimizing the number of pieces of equipment operated simultaneously. All construction activities would adhere to the VCAPCD Rule 50 for Opacity, Rule 51 for Nuisance, and Rule 55 for Fugitive Dust. As such, construction related impacts would not be considered significant.

4.3-23 Project Impacts, Table 4.3-8, Operational Emissions

**Table 4.3-8
Operational Emissions**

Source	Pollutant (pounds/day)					
	ROG	NOx	CO	SOx	PM10	PM2.5
Maximum <u>mitigated</u>	29.71	22.93	103.64	0.41	29.44	8.33
VCAPCD threshold	25	25	—	—	—	—
Threshold exceeded?	Yes	No	—	—	—	—

Source: Refer to Air Quality and Greenhouse Gas Modeling data sheets in **Appendix 4.3**.

Notes: CO = carbon monoxide; NOx = nitrogen oxide; PM10 = particulate matter less than 10 microns; PM2.5 = particulate matter less than 2.5 microns; ROG = reactive organic gas; SOx = sulfur oxide.

4.3-25 Project Impacts

An HRA was prepared to determine whether diesel particulate emissions from construction ~~under~~ within the Santa Paula West Specific Plan will cause significant impacts to nearby sensitive receptors. PM10 exhaust serves as a surrogate for diesel particulate emissions from off-road construction equipment. Emission estimates and associated construction year were generated from the CalEEMod output data files (provided in **Appendix 4.3**) for the mitigated exhaust PM10 pollutant category. **Table 4.3-9, PM10 Exhaust Emissions by Calendar Year**, lists the maximum daily PM10 exhaust emissions for each calendar year of construction.

4.3-26 Project Impacts

The carcinogenic risk estimate was predicted to be 8.7×10^{-7} (0.86 in 1 million) at the MEIR location. In comparison to the applicable 10 in 1 million threshold level referenced above, carcinogenic risks do not exceed the level posing no significant risk. Therefore, impacts are less than significant.

4.3-28 Project Impacts

The uses allowed within Specific Plan area are not anticipated to use hazardous or acutely hazardous materials in appreciable quantities. Any quantifiable stationary source health risks will generally occur within facility boundaries. TACs typically exist at industrial operations or commercial facilities, such as gasoline stations or dry cleaners. However, the airborne release of such TAC emissions from such facilities would be sufficiently small enough. Hazardous substances are regulated under the California Accidental Release Prevention (CalARP) Program. The CalARP Program satisfies the requirements of the Federal Risk Management Plan Program, and contains additional state requirements. The CalARP Program applies to regulated substances in excess of specific quantity thresholds. The majority of the substances have thresholds in the range of 100 to 10,000 pounds. Moreover, significant amounts of hazardous substances will typically be expected at industrial, manufacturing, and complex water or wastewater treatment plant land uses. The uses allowed by the Santa Paula West Business Park Specific Plan do not include any operations that require ~~large~~ that could pose a significant health risk amounts of hazardous materials. Accordingly, the Project will not result in

a significant impact with respect to use of hazardous materials during long-term operations.

4.3-28

Project Impacts

Odors are typically associated with industrial projects involving the use of chemicals, solvents, petroleum products, and other strong-smelling elements used in manufacturing processes, as well as sewage treatment facilities and landfills. ~~Commercial and light industrial uses are not typically associated with objectionable odor complaints.~~ Some restaurants may generate odors that nearby residents consider objectionable, but this is largely dependent upon the cooking products that are used, the design of the restaurant ventilation and filtration system, and the sensitivity of the nearby residents. The restaurant kitchen design characteristics are evaluated at the time that the operator of the restaurant is requesting approval of permits from the VCAPCD. The types of industrial activities that would occur with the Project are not known at this time, but would be evaluated at the time that permits to construct and operate are applied for from the APCD. Therefore, the potential impacts associated with objectionable odors will be less than significant.

4.3-30

Mitigation Measures, Construction Emissions

AQ-1: During clearing, grading, earthmoving, or excavation operations, excessive fugitive dust emissions shall be controlled by regular watering or other dust-preventative measures using the following procedures, as specified by the VCAPCD (including without limitation, to VCAPCD Rule 50 (Opacity) and Rule 51 (Nuisance):

On-site vehicle speed shall not to exceed 15 miles per hour (the Project Site will contain posted signs with the speed limit).

All on-site construction roads with vehicle traffic shall be watered as necessary to prevent excessive dust;

Streets adjacent to the Project reach shall be swept as needed to remove silt that may have accumulated from construction activities so as to prevent excessive amounts of dust.

All material excavated or graded shall be sufficiently watered to prevent excessive amounts of dust. Watering shall occur at least twice daily with complete coverage, preferably in the late morning and after work is done for the day.

All clearing, grading, earth moving, or excavation activities shall cease during periods of high winds (i.e., greater than 25 miles per hour averaged over one hour) so as to prevent excessive amounts of dust (contact the VCAPCD meteorologist for current information about average wind speeds).

All material transported off site shall be either sufficiently watered or securely covered to prevent excessive amounts of dust.

The area disturbed by clearing, grading, earth moving, or excavation operations shall be minimized to prevent excessive amounts of dust.

These control techniques shall be indicated on Project grading plans. The Applicant and/or its contractor shall be responsible for implementing these measures and compliance with this measure will be subject to periodic site inspections by the City.

4.3-31

Mitigation Measures, Operational Emissions

~~The Specific Plan would result in significant and unavoidable impacts with regard to ROG. VCAPCD recommends that feasible area source mitigation measures be included in all projects that have been determined to have a significant air quality impact. Consequently, the following measures shall be incorporated or imposed upon the Project.~~

AQ-6: Use low emission water heaters for ~~residential, retail, and~~ commercial water heating (Emissions reduction of 11 percent for ROG and 9.5 percent for NOx).

AQ-7: Construct pedestrian and transit friendly facilities such as wider sidewalks, bus stops with passenger benches and shelters, and bikeways and/or lanes and bike racks. Sidewalks and bikeways should be landscaped with trees (an approximately 4 percent emissions reduction).

4.3-32 Mobile Source Emissions

AQ-8: Provide shuttle/minibus service between the Project commercial and industrial land uses ~~and the Project retail land uses~~ and the Santa Paula downtown area during the lunchtime period (11:00 AM to 2:00 PM).

4.3-33 Long-Term Operations

AQ-13: The Applicant and/or its contractor shall prepare a TDM for review and approval by the City and VCAPCD, before the City issues building permits. The plan shall incorporate reasonable and feasible measures to reduce Project-related traffic and vehicle miles traveled. At minimum, the TDM Program shall include the following measures:

Provision of connections to identified adjacent City or regional trails.

Provision of adequate way-finding features to direct pedestrians and bicyclists to nearby Project and City destinations, such as school, retail, and civic facilities.

~~Provision of homeowner information packets prior to close of escrow, identifying local and regional nonvehicular transportation options, and providing homeowners with basic information regarding telecommuting options.~~

Provision of adequate setbacks and design features such that the proposed future enhancement of commuter rail opportunities is not hindered by Project design.

Construction of pedestrian- and transit-friendly facilities such as wider sidewalks, bus stops with passenger benches and shelters, bikeways, or lanes. Sidewalks and bikeways should be landscaped with trees.

Perform a traffic light synchronization study on streets impacted by Project development to reduce vehicle queuing time.

The Project shall offset the increase in daily emission over the 25 pounds of reactive organic compounds and nitrogen oxides per day either through the purchase of emission offsets or through the in-lieu fees shall be paid to fund off-site TDM facilities or services, if such a program has been established at that time. These fees can reduce emissions from non-Project-generated motor vehicle trips by funding programs to promote ridesharing, public transit, and bicycling. The amount of this financial contribution should be calculated on a pro-rate basis as determined to be equitable by the VCAPCD, and in accordance with the VCAPCD Guidelines. These fees should be paid prior to the issuance of building permits by the County. The applicant shall demonstrate the availability of the offsets or contribution to fund off-site TDM services to the VCAPCD through a contract or other agreement with the offset source(s), which binds the reduction to the Project.

~~AQ 14: The Applicant and/or its contractor shall install EPA certified wood-burning stoves or fireplace inserts. If this is not feasible, then the installation of a ceramic coating on the honeycomb inside a catalytic combustor must be utilized or the use of natural gas fireplaces may be used as a feasible alternative.~~

Section 4.4, Biological Resources

Page

Revision:

4.4-4

Field Surveys

On May 20, 2015, BRC conducted a reconnaissance-level survey of the Project Site and surroundings. The area was methodically surveyed to document the existing conditions, wildlife and plant species present, and plant communities. It is not usually not possible to schedule all needed field surveys during the optimum survey period for all the special-status plant and wildlife species known to occur in the region. Therefore, the objective of the field survey was to determine the likelihood of occurrence of any special-status plant or wildlife species based on the presence/absence of suitable habitat and other natural history elements that might predict their occurrence.

4.4-22 American Badger (*Taxidea taxus*)—Listing: CA Species of Special Concern

This species was not observed during the Project surveys; however, the avocado orchard and the ecotone between the agricultural fields and Adams Barranca provides forging habitat for this species.

4.4-35 Project Impacts

As discussed previously in Existing Conditions, Southern California black walnut (*Juglans californica*) is the only special-status plant species that was documented or determined to have a high likelihood of occurring within the Project Site. A total of 19 individual trees are located along the perimeter of the Project Site, mainly along the southwest boundary within the riparian habitat of the Adams Barranca and along the SR 126 right-of-way along the southeast boundary of the Project Site, however, the Project does not currently propose to remove any of the 19 Southern California black walnut trees.

4.4-37 Project Impacts

Development under the Specific Plan would include removal of existing vegetation within the Project Site; grading to reach finished grades to support structures; installation of storm drains to carry surface runoff; and construction of buildings, driveways, and parking lots. This would require the removal of the agricultural drainage ditch that bisects the Project Site and is considered State Waters pursuant to the Fish and Game Code and the Clean Water Act. Other state and federal jurisdictional waters (i.e., those within Adams Barranca) would be preserved through an Open Space dedication and ~~prevention~~ the prohibition of construction activities within the Barranca. **Table 4.4-8, Impacts to Jurisdictional Waters**, provides a breakdown of the acres and linear feet of impacts of the Project.

While all Project impacts to ACOE and CDFW jurisdictional areas are considered potentially significant, and they would be mitigated to a less than significant level through the conditions ~~identified~~ imposed pursuant to the Project's 404, 401, and 1602 permits/agreement as well as by mitigation measures identified by this EIR.

4.4-38 Project Impacts, Increases in Light and Glare

The development of the Project Site would increase the number of nighttime light and glare sources on the site. Light and glare can “spill over” into adjacent open space areas, increasing the level of light currently experienced there. Nighttime illumination is known to adversely affect some species of animals in natural areas. Nighttime light can disturb breeding and foraging behavior and can potentially alter foraging and breeding behavior of nocturnal birds, mammals, and invertebrates, which is considered a potentially significant impact. However, Section 4.6 of the Specific Plan for the proposed Project addresses lighting guidelines for the Project Site, including but not limited to, height of lighting, requirements for screened lighting, and submittal of a lighting plan to the police Chief or designee for approval prior to issuance of a building permit. Impacts from lighting and glare would be considered less than significant.

4.4-38 Project Impacts, Increase in Human Presence

The Open Space area designations of the Specific Plan, upland buffers from the riparian area and development under the Project, and the Project characteristics that would provide predominantly indoor daytime work areas would minimize any potential for increase human disturbance to the Adams Barranca. Therefore, indirect impacts from human encroachment would be less than significant.

4.4-42 Project Impacts, Final Recovery Plan for the Least Bell’s Vireo

The Project is consistent with the recovery plan for this species because the least Bell’s vireo habitat present on the site would not be impacted. ~~The Project would result in~~ All potentially significant impacts to the least Bell’s vireo would be mitigated by ~~However, mitigation~~ measures are included within this EIR, and the Project would include an Open Space dedication along the western boundary to avoid impacts to habitat for least Bell’s vireo individuals in the Santa Clara River Watershed.

4.4-42 Project Impacts, Final Recovery Plan for the Southwestern Willow Flycatcher

~~The Project is consistent with the recovery plan for this species because if southwestern willow flycatchers are located on site, they would not be permanently impacted. All~~ Although, the Project would result in potentially

~~significant~~ impacts to the southwestern willow flycatcher during construction would be mitigated by, mitigation measures are included with in this EIR, and the Project includes an Open Space dedication along the western boundary to avoid impacts to habitat for southwestern willow flycatcher individuals in the Santa Clara River Watershed. The southwestern willow flycatchers would not be permanently impacted, and therefore the Project is consistent with the recovery plan for.

4.4-43

Cumulative Impacts

The development of approximately 49 acres of already disturbed agricultural lands and 4.48 acres of urban developed land on the Project Site would have limited adverse effects on the diversity and abundance of native flora and fauna either locally or in the region. Natural habitat areas containing suitable habitat for special-status animal and plant species is proposed to be preserved. The impacted area of the Project Site supports only marginally suitable habitat for a few special-status animals, and has no potential to support a high diversity of native plants. Most wildlife species that could be expected to use the Project Site are species that are adapted to the disturbance that is caused by human-induced activities. Because of the present condition of the Project Site and the surrounding lands, it is unlikely that development of the site would contribute significantly to cumulative adverse impacts to regional flora and fauna. However, ~~the~~ the loss of habitat associated with development of the Project area would contribute to the overall cumulative loss of biological resources in the Santa Paula region. ~~However,~~ Given that the impacted habitat within the Project area consists primarily of agricultural and urban developed land, and the impacted waters are small (less than 1 acre), the incremental contribution of the Project to this habitat loss is not cumulatively considerable and, therefore, not significant.

4.4-43

Mitigation Measures, BR-1

Before issuance of a grading permit, the Applicant must identify on grading plans, the locations of any protected trees (such as the Southern California black walnut, *Juglans californica*) and must include a report pertaining to preserving the tree(s) that could be affected by the grading activity. The report shall be prepared by a tree expert and shall evaluate the ~~subdivider's~~ Applicant's proposals for protected tree preservation, including avoiding grading, land movement, or other

activity within the drip line of any protected tree. Prior to grading, the drip line must be fenced to prevent earthmoving equipment from inadvertently entering the drip line. In the event protected tree cannot be avoided, then the Applicant must provide a tree report in accordance with the City's Tree Protection Ordinance and must provide for the replacement or relocation of any protected trees that are to be removed, or would be subject to landmoving or grading within its drip line.

4.4-44

Mitigation Measures, BR-3

To avoid impacts to native nesting birds, the Applicant must retain a qualified biologist (with selection to be ~~reviewed~~ approved by the City) to conduct nest surveys in potential nesting habitat within the Project Site prior to construction or site preparation activities. Specifically, within 30 days of ground disturbance activities associated with construction or grading, a qualified biologist shall conduct weekly surveys to determine if active nests of bird species protected by the Migratory Bird Treaty Act (MBTA) or the California Fish and Wildlife Code are present in the construction zone or within 300 feet (500 feet for raptors) of the construction zone. Surveys for special-status bird species can be conducted concurrently with general nesting bird surveys. Because birds known to use the Project area nest during the late winter, breeding bird surveys shall be carried out both during the typical nesting/breeding season (mid-March through September) and in January and February. The surveys shall continue on a weekly basis, with the last survey being conducted no more than 3 days prior to initiation of clearance or construction work. If ground disturbance activities are delayed, then additional pre-construction surveys shall be conducted such that no more than 3 days shall have elapsed between the last survey and the commencement of ground disturbance activities.

Surveys shall include examination of trees, shrubs, and the ground within grassland for nesting birds, as several bird species known to occur in the area and are shrub or ground nesters, including burrowing owl, California horned lark, and mourning dove. In addition, due to the potential for least Bell's vireo and southwest willow flycatcher to exist, protocol surveys should be completed prior to the start of construction.

4.4-45

Mitigation Measures, BR-6

To avoid potential impacts to the Pallid bat (*Antrozous pallidus*) and the Hoary Bat (*Lasiurus cinereus*), the Applicant must retain a qualified biologist (with selection to be reviewed by the City) to conduct roosting bat surveys within the Specific Plan area prior to site preparation activities. Thirty days before ground disturbance activities associated with construction or grading, a qualified biologist shall conduct weekly surveys in accordance with standard protocols to determine if roosting western red bats are present in the construction zone or within 300 feet of the construction zone. Roosting bat surveys shall be carried out from March through September. Surveys for special-status bat species may be conducted concurrently with nesting bird surveys. The surveys shall continue on a weekly basis, with the last survey being conducted no more than 3 days prior to initiation of clearance or construction work. If ground disturbance activities are delayed, then additional pre-construction surveys shall be conducted such that no more than three days shall have elapsed between the last survey and the commencement of ground disturbance activities. Surveys shall include examination of trees and large shrubs in which this species is known to roost. Any bats found outside of the breeding season (May through August) shall be relocated by having a qualified biologist remove the bat from the roost. If roosting female bats are found with young during the breeding season (May through August) clearing and construction activities within 300 feet of the roost, shall be postponed or halted until the roost is vacated and juveniles have been weaned, as determined by the biologist. Limits of construction to avoid an active roost site shall be established in the field with flagging, fencing, or other appropriate barriers. Construction personnel shall be instructed on the sensitivity of nest areas. The biologist shall serve as a construction monitor during those periods when construction activities will occur near active roost areas to ensure that no inadvertent impacts on these roosts will occur. The results of the survey, and any avoidance measures taken, shall be submitted to the City of Santa Paula within 30 days of completion of the pre-construction surveys and construction monitoring to document compliance with applicable state and federal laws pertaining to the protection of these bat species.**4.4-46**

Mitigation Measures, BR-7

Before issuance of a grading permit for areas that require state permits, the applicant shall coordinate with the CDFW to verify the impact to state-protected waters and associated vegetation on the Project Site. A Streambed Alteration Agreement (SAA) must be obtained, and ~~mitigation measures~~ conditions of approval, including but not limited to buffer zones, recommended by the CDFW as part of the SAA shall be implemented. The SAA shall be provided to the City prior to issuance of a grading permit.

Section 4.5, Cultural Resources**4.5-21-22****Cumulative Impacts**

Potential impacts to cultural resources within the Project Site would be mitigated to less than significant with implementation of mitigation measures. Additionally, ~~P~~previous development within Ventura County has resulted in the loss of much of the evidence of the prehistoric occupation and use of the area. As discussed in **Section 3.0, Related Projects**, current development projects within the City of Santa Paula include a number of projects ranging from relatively small residential developments to larger residential development, commercial and industrial developments, and mixed-use developments. Other Specific Plan projects that would likely have similar potentially significant impacts to paleontological, archaeological, and historic resources include the remainder of West Area 2, Adams Canyon, Fagan Canyon, and ~~the recently approved~~ East Area 1 Specific Plan and East Area 2 Projects. The ~~Specific Plan Project,~~ in combination with other currently planned projects, ~~would~~ may result in the potential for a cumulatively significant contribution to significant cumulative impacts. ~~However,~~ ~~M~~mitigation measures would reduce the potentially significant cumulative contribution to paleontological, archaeological, and historical resources. Therefore, impacts are not considered cumulatively considerable and potentially significant.

4.5-22**Mitigation Measures, CUL-3**

In the event that previously unidentified archaeological resources are discovered during building construction, the contractor must cease work in the immediate area and the City Planning Director shall be contacted. An independent qualified archaeologist, retained by the City at the expense of the applicant, must assess

the significance of the find and make mitigation recommendations, which shall be implemented to the extent feasible.

Section 4.6, Geology and Soils

Page

Revision:

4.6-25

Project Impacts

Construction activities would comply with erosion control requirements, including existing grading and dust control measures, imposed by the City pursuant to grading permit regulations. Specifically, each construction project permitted under the Specific Plan would be required to comply with City's necessary permits, plans, plan checks, and inspections to reduce the effects of sedimentation and erosion. In addition, as discussed in **Section 4.9, Hydrology and Water Quality**, the Project would be required to have a Storm Water Pollution Prevention Plan (SWPPP) pursuant to the National Pollutant Discharge Elimination System (NPDES) permit requirements. As part of the SWPPP, best management practices (BMPs) would be implemented during construction to reduce soil erosion and pollutant levels to the maximum extent possible.

4.6-26

Cumulative Impacts

Geologic impacts are typically confined to a project site or within a localized area and do not affect off-site areas associated with the related projects identified in **Section 3.0, Related Projects**, or other growth in the City. At a minimum, all development occurring within the City of Santa Paula would be subject to CBC and construction standards relative to seismic and other geologic conditions that are prevalent within the region. Also, individual project geotechnical investigation reports, required prior to permit approval, would provide recommendations to account for site-specific design requirements to avoid subjecting on- and off-site properties to geologic hazards, in accordance with the CBC. With regard to erosion and sedimentation, development under the Santa Paula West Specific Plan and related projects are required to implement a SWPPP during construction, as required by the NPDES permit, to minimize impacts to off-site properties from the effects of erosion. Therefore, based on the Santa Paula West Specific Plan design (including recommendations within the geotechnical reports), and compliance with applicable regulations and plan review, the Project

will meet the applicable standards and will sufficiently reduce its incremental cumulative geology and soil impacts to a less than significant cumulative impact.

4.6-27

Mitigation Measures, G-1

Additional explorations must be performed at the tentative tract map and grading plan review stages of the development planning. The purpose of the explorations would be to establish required removal depths and delineate any portion of the Project Site deemed susceptible to seismically induced settlement. The Project shall comply with all CBC/UBC requirements for seismic safety.

Section 4.7, Greenhouse Gases

Page

Revision:

4.7-24

Cumulative Impacts

Climate change is a cumulative impact from various global sources of activities that incrementally contribute to global GHG concentrations. Individual projects provide a small addition to total concentrations but contribute cumulatively to a global phenomenon. The goal of AB 32 is to require GHG emission reductions from existing conditions. As a result, cumulative GHG and climate change impacts must be analyzed from the perspective of whether they would impede the state’s ability to meet its emission reduction goals.

To achieve Statewide goals, CARB is in the process of implementing regulations to reduce Statewide GHG emissions. However, currently, no applicable significance thresholds, specific reduction targets, and approved policies or guidance are in place to assist in determining significance at the project or cumulative level. Additionally, currently no generally accepted methodology exists to determine whether GHG emissions associated with a specific project represent new emissions or existing and/or displaced emissions.

GHG emissions reductions would be achieved through energy-efficient lighting and building design; installation of low-flow appliances; and water conservation. The methods used to establish this relative reduction are consistent with the approach used in the CARB’s Scoping Plan for the implementation of AB 32 through 2020. The Project’s features and GHG reduction measures make the

Project consistent with the goals of AB 32. Therefore, the Project will result in a less than significant contribution to cumulatively significant GHG emissions.

~~Although the Specific Plan is expected to emit GHGs, the emission of GHGs by a single project into the atmosphere is not itself necessarily an adverse environmental effect. Rather, it is the increased accumulation of GHG from more than one project and many sources in the atmosphere that may result in global climate change. However, currently there are no significance thresholds, specific reduction targets, and no approved policy or guidance to assist in determining significance at the project or cumulative level. Additionally, there is currently no generally accepted methodology to determine whether GHG emissions associated with a specific project represent new emissions or existing, displaced emissions. Implementing the project design features and GHG-reducing measures would result in a net decrease in GHG emissions. The Project’s design features and GHG reduction measures make the Specific Plan consistent with the goals of AB 32.~~

Section 4.8, Hazards and Hazardous Materials

Page

Revision:

4.8-16

Project Impacts

The Project proposes the development of a business park that would include commercial and light industrial uses with some areas for passive open space. Operation of the Project ~~would~~ may involve the use, transport, production, handling, or storage of hazardous materials that have the potential to create a significant hazard to people on the Project Site. These materials may include the use of fuels, grease, solvents, paints, and pesticides and other various landscaping products. The storage and disposal of these hazardous materials on the Project Site would comply with City and SPFD regulations and standards.

Furthermore, the Ventura County Transportation Commission (VCTC) owns the 100-foot-wide railroad corridor that bisects the Project. While the railroad has the capacity to serve as a corridor for the transport of hazardous materials, the railroad is currently out of service and would not pose any dangers to people on the Project Site related to the accidental release of hazardous materials, such as a fire, explosion, or chemical spill. However, if the railroad is commissioned for

service within the future, any transport of hazardous materials would comply with US Department of Transportation (USDOT) Federal Railroad Administration (FRA) safety regulations. Therefore, the probability of an accident involving the transport of hazardous materials within proximity to the Project Site is considered to be very low unlikely. Impacts would be less than significant.

4.8-18**Project Impacts**

As provided previously, the Project ~~would~~ may involve the use of hazardous materials onsite typical of industrial-type uses. The storage and disposal of these hazardous materials on the Project Site would comply with City and SPFD regulations and standards. Therefore, impacts would be less than significant.

4.8-21**Project Impacts**

The City requires preparation of a detailed Construction Traffic Management Plan, which would be submitted to the City for review and approvals consistent with the City's existing standards and emergency response plans. The plan would provide notification to the City of Santa Paula Police Department (SPPD), which oversees emergency operations within the City in cooperation with the Ventura County OES.⁶ The OES is coordinated through the Ventura County Sherriff's Department and is responsible for countywide disaster planning, mitigation, response, and recovery activities through the implementation of the Ventura County Hazard Mitigation Plan. The City's designated evacuation routes are along SR 126 and SR 150. While, SR 126 runs along the southern boundary of the Project Site, construction activities of the Project are not anticipated to interfere with access to the roadway or interfere with operation of the County's Hazard Mitigation Plan. Emergency access and potential traffic access impacts would be less than significant.

As with much of southern California, the Specific Plan area has the potential for ~~residents and~~ employees to encounter human-made and natural hazards, which could cause undue hardship to ~~residents and~~ employees. Human-made hazards include the potential release of hazardous materials; the potential for biological or chemical attacks from foreign and domestic terrorism; and the potential for

6 City of Santa Paula, *General Plan*, "Safety Element," (1998).

fires started by humans. Natural hazards include flooding, seismic activity, extreme weather conditions, and fires that are started naturally.

4.8-21

Project Impacts

The Specific Plan is not located ~~not~~ within a CAL FIRE designated LRA or SRA. The nearest FHZA within the SRA is located just south of the Specific Plan area. The foothills to the south of the Specific Plan area are designated Moderate Severity, while areas further up the South Mountains carry a Very High Severity classification. Based on the City of Santa Paula General Plan, the Project Site is located within an area with minimal fire hazard risk. As the Project involves the development of commercial and light industrial uses across the site's estimated 54 acres. Thus, there would be minimal vegetation that could pose a flammable hazard.

4.8-22

Cumulative Impacts

Related projects may be located on or near a site included on a list of hazardous material sites compiled pursuant to Government Code Section 65962.5. Development of any of the related projects would be required to comply with existing applicable laws and regulations pertaining to hazardous wastes, and the risk with identified hazardous material sites would be eliminated or reduced through proper handling, disposal practice, and/or clean up procedures. Accordingly, cumulative impacts to the public or environment associated with development on or near listed contaminated sites would be less than significant.

4.8-23-4.8-24

Mitigation Measures, HM-5

In the unlikely event that hazardous materials are encountered during grading or excavation activities anywhere on the Project Site, earthwork must be temporarily suspended in order to coordinate investigation/remediation efforts with the oversight of the Santa Paula Fire Department. An environmental professional (e.g. a professional geologist) is recommended to provide oversight and project monitoring to ensure the health and safety of all workers. A remedial plan consistent with federal and state remedial requirements, must be developed by a professional geologist approved by the City and submitted to the City Planning Director, or designee, for approval as required before continued work in the area.

Section 4.9, Hydrology and Water Quality

Page

Revision:

4.9-4

Watershed Description

As shown in **Table 4.9-3**, a small portion of the Santa Paula West Business Park existing property drains west into Adams Barranca. Adams Barranca is a raised channel; on average, the top of the channel is 2 feet higher than the adjacent grade on the property. This portion of the property is subject to flooding during a 100-year storm event from Adams Barranca.⁷ The SR 126 westerly culverts (Area B) ~~handle~~ currently accept the flow from approximately 27 acres. Overflow from pipe inlet blockage travels easterly to two other culverts under SR 126 or farther east to the inlet at the end of Faulkner Road into a 72-inch reinforced concrete pipe (RCP) leading to Todd Lane Drain. The SR 126 easterly culverts (Areas C and D) handle flows from approximately 31 acres. Overflow from pipe inlet blockage travels easterly to the inlet at the end of Faulkner Road into a 72-inch RCP leading to Todd Lane Drain.

4.9-16

Project Impacts

Development of the Specific Plan would involve construction activities over an estimated ~~2-5~~10-year period. Proposed grading and construction activities would involve earth movement and the use of heavy equipment. Peak stormwater runoff could result in short-term sheet erosion with areas of exposed or stockpiled soils. Additionally, the compaction of soils by heavy equipment may reduce the infiltration capacity of soils and increase runoff and erosion potential. Given the above, pollutants such as soil, sediments, and other substances associated with construction activities (e.g. oil, gasoline, grease, and surface litter) could be present in stormwater runoff from the site.

4.9-18

Project impacts

Overall, the BMPs and the project design features would address the anticipated and expected pollutants of concern from operation of the Project. Degradation of water quality from the Project would be managed in accordance with all

⁷ FEMA Flood Map Service Center (Map Numbers 0611C0778E and 0611C0779E), <https://msc.fema.gov/portal/search?AddressQuery=Faulkner%20Road%2C%20Santa%20Paula>.

existing applicable federal, state, and local water quality rules and regulations to effectively minimize the Project's impact on water quality. Accordingly, impacts would be less than significant.

4.9-18**Project Impacts**

Based on the above, the Project will not result in a significant new demand for water and will not substantially deplete groundwater supplies. In addition, the Project would use less water than the existing agricultural operations, and the Specific Plan would incorporate design features such as bioswales, bioretention cells, infiltration trenches and permeable pavement to allow surface water runoff percolation. Therefore, the Specific Plan would not substantially interfere with groundwater recharge. There will be no substantial impact to local groundwater recharge. Therefore, impacts would be less than significant.

4.9-19**Project Impacts**

The Project does not alter the course of a stream or river, however ~~S~~ site-clearing and grading operations have the ~~greatest~~ potential for discharging sediment downstream during storm events. As discussed above, construction and grading activities would involve earth movement and the use of heavy equipment. Peak stormwater runoff could result in short-term sheet erosion with areas of exposed or stockpiled soils. Additionally, the compaction of soils by heavy equipment may reduce the infiltration capacity of soils and increase runoff and erosion potential.

4.9-20**Project Impacts**

As mentioned previously, the Specific Plan would not substantially alter drainage patterns within the Project area. The Specific Plan would provide future development in accordance with proposed land use designations for the Specific Plan area, nor alter a stream or river. Given that the Specific Plan area consists of undeveloped agricultural land, development would result in an increase in the rate and amount of surface runoff generated by the Specific Plan Area.

4.9-20**Cumulative Impacts**

The cumulative impact analysis in this Section considers related development projects in the area. With regard to water quality, the related projects would be

required to comply with the NPDES General Construction Permit, including implementation of a site-specific SWPPP, to prevent polluted runoff from entering local stormwater drainage systems during construction activities. Additionally, each related project would be subject to NPDES requirements and applicable SPMC requirements. The Project would not contribute to a cumulatively significant hydrology or water quality impact. First, the Project does not alter any streams or rivers. Second, ~~Given that~~ each related project would be required to comply with NPDES requirements and local regulations designed to prevent polluted runoff from entering local storm drain systems and receiving water bodies during construction and after development, the cumulative impact to water quality would be less than significant. Furthermore, in compliance with NPDES, the cumulative impact related to erosion and siltation would also be less than significant.

Section 4.10, Land Use

Page

Revision:

4.10-22-4.10-27

LAFCo Commissioners Handbook Standards

The Project is consistent with the Handbook policies that favor annexations to cities, as set forth in Section 3.3.1 General Standards for Annexation to Cities and Districts, ~~because it would:~~

~~Eliminate islands of unincorporated territory and fill in gaps within the City of Santa Paula's jurisdictional boundaries. While the VCTC railway that bisects the Project Site is not a part of the Project, the areas along the railroad right-of-way would be improved with landscaped screening to ensure compatibility with the Project. Additionally, an existing at-grade crossing will be realigned approximately 100 feet to the east to align with Beckwith Road. Implementation of the Project around the VCTC railway would not result in any conflicts with surrounding City uses.~~

~~Facilitate urbanized development in the western portion to the City of Santa Paula, consistent with the City's existing General Plan policies that envision this area for urban expansion to accommodate City growth through 2020. Buildout of the Specific Plan area is imminent, based upon future market and economic conditions, with concurrent infrastructure improvements and extension of public services to maintain desired levels of service.~~

Extensions of municipal services are needed to support the range and intensities of land uses envisioned for this area by the City's General Plan, and the City of Santa Paula has the resources to provide such services in an efficient manner. The Project Site is located within the City's SOI and is proposed for expansion within the General Plan. The Proposed Project would benefit the community as it would be used for public purposes.

3.3.1.1 Factors Favorable to Approval:

a. The proposal would eliminate islands, corridors, or other distortion of existing boundaries.

The proposed Project would extend the existing City boundary and would not create any islands of unincorporated territory or distort the existing boundary of the City.

b. The affected territory is urban in character or urban development is imminent, requiring municipal or urban-type services.

The Project Site is located within the City's Sphere of Influence (SOI) and has been identified as an expansion area within the City's General Plan since 1998 to meet the need for additional light industrial and business park land in the City. Because the area is currently undeveloped, future development would require the extension of urban services.

c. The affected territory can be provided all urban services by the city or district as shown by the city's or district's service plans and the proposal would enhance the efficient provision of urban services.

Extensions of municipal services are needed to support the range and intensities of land uses envisioned for this area by the City's General Plan, and the City of Santa Paula will provide services.

The Santa Paula Water Master Plan, plans for the expansion of West Area 2, stating "The water demands of West Area 2 are not expected to be significant, and are not expected to affect the overall infrastructure requirements for the system. However, fire flow needs could be substantial, depending on the size and types of building that may be proposed for this commercial area. To supply the required fire flows, a pipeline that crosses the freeway will likely be needed of significant size (12 or 16-inch). When the plans for the development are available, and water and firefighting needs are better defined, a detailed water system analysis is recommended."⁸

⁸ Boyle Engineering Corporation, City of Santa Paula Potable Water System Master Plan (Final; October 2005), 127-128, <http://www.ci.santa-paula.ca.us/PubWorks/PotableWaterMasterPlanOct2005.pdf>.

The Santa Paula Wastewater Master Plan, also provides for wastewater service for West Area 2 to meet a projected wastewater average dry weather flow of 0.1088 million gallons per day (mgd).⁹

d. The proposal is consistent with state law, adopted spheres of influence, applicable general and specific plans, and these policies.

The Project Site is located within the City's SOI and is identified as an expansion area the City's General Plan. The proposed Project would be consistent with the City of Santa Paula General Plan and Municipal Code.

e. The proposal is for the annexation of city or district owned property, used or to be used for public purposes.

The Project does not include City- or district-owned property.

As shown, the proposed Project is consistent with factors (a) through (d), and factor (e) does not apply to the proposed Project.

⁹ Boyle Engineering Corporation, City of Santa Paula Wastewater System Master Plan (September 2005), Table 3-2, <http://ci.santa-paula.ca.us/PubWorks/WASTEWATERMASTERPLANSEPTEMBER2005.pdf>

3.3.1.2 Factors Unfavorable to Approval:

a. The proposal would create or result in corridors, peninsulas, or flags of city or district area or would otherwise cause or further the distortion of existing boundaries.

The proposed Project would extend existing City boundaries and would not create islands of unincorporated territory.

b. The proposal would result in a premature intrusion of urbanization into a predominantly agricultural or rural area.

The Project Site is located within the City's SOI and has been identified as an expansion area in the City's General Plan since 1998 to meet the need for light industrial and business park land in the City and, for this reason, annexation of the Project Site at this time would not result in the premature urbanization of a predominantly agricultural or rural area.

c. The proposal is inconsistent with state law, adopted spheres of influence, adopted general or specific plans, adopted habitat conservation and/or restoration plans, other applicable plans adopted by any governmental agency, or these policies.

The Project Site is located within the City's SOI and is identified as an expansion area the City's General Plan. The proposed Project would be consistent with the City of Santa Paula General Plan and Municipal Code. There are no habitat conservation plans or other applicable plans adopted by other governmental agencies the Project is inconsistent with.

d. For reasons of topography, distance, natural boundaries, or like considerations, the extension of services would be financially infeasible, or another means of supplying services by acceptable alternatives is preferable.

The proposed Project is adjacent to existing uses within the City that currently utilize services. Services can be extended cost effectively to the proposed Project Site from adjacent developed areas in the City of Santa Paula in accordance with the City's utility master plans in

e. Annexation would encourage a type of development in an area that due to terrain, isolation, or other economic or social reason, is not in the public interest.

The Project Site is relatively flat and borders developed portions of the City of Santa Paula to the east. The Project Site is located within the City's SOI and has been identified as an expansion area in the City's General Plan since 1998. Annexation of the site would be in the public interest.

f. The proposal appears to be motivated by inter-agency rivalry or other motives not in the public interest.

The Project would be consistent with the Guidelines for Orderly Development that provide for development to occur within the cities and not within the unincorporated County. The Project proposes to annex land that has been identified within the City's General Plan and SOI and is proposed for expansion within the General Plan.

g. The proposed boundaries do not include logical service areas or are otherwise improperly drawn.

The proposed Project would not create distorted boundaries and would extend existing boundaries as provided for in the SOI. Infrastructure improvements and extension of public services would be extended in an efficient manner.

h. The proposal area would accommodate new development and includes a tsunami inundation zone, wildfire hazard zone, FEMA designated floodway or floodplain, or other hazardous area designated by federal, state or local public agencies, unless the Commission determines that the hazard or hazards can be adequately mitigated.

The proposed Project would not be located in a tsunami inundation zone, wildfire hazard zone, or other hazardous area designated by federal, state or local public agencies. As indicated in the Draft EIR, the western portion of the Specific Plan site located adjacent to Adams Creek is currently located within a FEMA-designated 100-year floodplain area. However, a review of historic flooding, existing contours, and site features concludes the Flood Zone limit shown on the FIRM maps is inaccurate.

i. The proposal will result in an unacceptable significant adverse impact(s) to the environment as determined by the Commission.

Mitigation is identified in the Final EIR for all significant impacts identified for the Project including Agricultural Resources, Air Quality, Biological Resources, Cultural Resources, Geology and Soils, Hazards and Hazardous Materials, Noise, Transportation and Traffic, and Utilities.

As shown, the proposed Project would not result in any conditions that would be unfavorable as outlined in the factors (a) through (i).

SECTION 3.3.2 GENERAL BOUNDARY CRITERIA

3.3.2.1 LAFCo Favors Applications with Boundaries that do the Following:

a. Create logical boundaries that coincide with existing and planned service areas and, where possible, eliminate previously existing islands.

The proposed Project would create logical municipal service boundaries within the City's established SOI. The Project Site is within an area where the City has planned for the provision of urban services.

b. Follow natural and man-made features, such as ridge lines drainage areas, watercourses, and edges of right-of-way, provided they coincide with lines of assessment or ownership, or are described by metes and bounds legal descriptions which can easily be used for mapping lines of assessment or ownership.

The Project extends to a natural boundary on the west, the Adams Barranca, and coincides with existing rights-of-way and parcel boundaries.

c. Include adjacent urbanized areas which are receiving or which may require urban services such as public water and/or sewer services.

The Project Site is currently undeveloped land within the City's SOI and is not adjacent to any existing unincorporated areas receiving or requiring urban services.

As shown, the proposed Project is consistent with factors (a) and (b), and factor (c) does not apply.

3.3.2.2 LAFCo Discourages Applications with Boundaries that:

a. Split neighborhoods or divide an existing identifiable community, commercial district, or other area having a social and economic identity.

The proposed Project would not split or divide any existing communities, commercial districts, or other areas having a social and economic identity.

b. Create areas where it is difficult to provide services.

The proposed Project would create logical municipal service boundaries within the City's established SOI.

c. Create boundaries which result in islands, peninsulas, flags, "pinpoint contiguity," "cherry stems," or cause, or further, the distortion of existing boundaries.

The proposed Project would extend existing City boundaries and would not create boundaries which result in islands, peninsulas, flags, "pinpoint contiguity," "cherry stems," or cause, or further, the distortion of existing boundaries.

d. Are drawn for the primary purpose of encompassing revenue-producing territories.

The Project would be consistent with the City's existing General Plan that identifies this area for urban expansion to accommodate City growth through 2020. The General Plan identifies this area for industrial and research and development uses.

As shown, the proposed Project would not result in any conditions that would be discouraged by LAFCo as outlined in factors (a) through (d).

SECTION 3.3.5 AGRICULTURE AND OPEN SPACE PRESERVATION

3.3.5.1 Findings and Criteria for Prime Agricultural and Existing Open Space Land Conversion

LAFCo will approve a proposal for a change of organization or reorganization which is likely to result in the conversion of prime agricultural or existing open space land use to other uses only if the Commission finds that the proposal will lead to planned, orderly, and efficient development. For the purposes of this policy, a proposal for a change of organization or reorganization leads to planned, orderly, and efficient development only if all of the following criteria are met:

a. The territory involved is contiguous to either lands developed with an urban use or lands which have received all discretionary approvals for urban development.

The Project Site is adjacent to urbanized land within the City of Santa Paula to the east. Additionally, to the north of the Project Site, beyond Telegraph Road, are additional areas containing urban uses.

b. The territory is likely to be developed within 5 years and has been pre-zoned for nonagricultural or open space use. In the case of very large developments, annexation should be phased wherever possible.

The Project Site has been designated in the City's General Plan as an expansion area since 1998. With approval of the proposed Project, the site will be pre-zoned for nonagricultural use.

c. Insufficient non-prime agricultural or vacant land exists within the existing boundaries of the agency that is planned and developable for the same general type of use.

The City completed an inventory of vacant land within the City limits for the City's 2013-2021 Housing Element Update. This inventory identified approximately 60 acres of vacant, residentially land, including several small vacant commercial properties, within the current city limits Those vacant sites are not contiguous and are dispersed throughout the City.

In addition to these 60 acres of vacant land, the City has adopted Specific Plans for the East Area 1 and East Gateway Specific Plan Areas on the eastern edge of the City. Each of these Specific Plans designates small areas for business park uses. The East Gateway Specific Plan area is, however, primarily planned for development with community level retail commercial uses.

The small amount of vacant land available inside the City limits and available for development with light industrial and business park uses is not sufficient to meet the objectives in the City's General Plan. The West Area Expansion Area is the primary area for additional light industrial uses identified in the City's General Plan. There is insufficient non-prime agricultural or vacant land within the City's existing boundaries that is planned and developable for the same general type of use. As the parcel of vacant land are dispersed and not contiguous, they do not provide sufficient site area to enable orderly, efficient and planned development of the commercial and light industrial uses envisioned for the Project area in the Santa Paula General Plan.

Other undeveloped land is available within the City's Sphere of Influence includes other expansion areas identified in the Santa Paula General Plan. They include Adams and Fagan Canyons located well north of SR 126 and have limited access. Because of the existing characteristics of these expansion areas, the Santa Paula General Plan limits development in Adams Canyon to single-family homes, a destination resort hotel, and a golf course, along with public facilities. Development permitted in Fagan Canyon by the General Plan includes single-family residences with supporting public facilities and a limited amount of neighborhood commercial uses. As such, these areas do not have the locational characteristics required for light industrial uses, or are not large enough to accommodate these uses.

d. The territory involved is not subject to voter approval for the extension of services or for changing general plan land use designations. Where such voter approval is required by local ordinance, such voter approval must be obtained prior to LAFCo action on any proposal unless exceptional circumstances are shown to exist.

The affected territory is not subject to voter approval for the extension of services or for the proposed minor changes in existing City General Plan land use designations. The proposed Specific Plan would include the annexation of land located within the City Urban Restriction Boundary (CURB). Measure L6 is not triggered by the proposed Project.

e. The proposal will have no significant adverse effects on the physical and economic integrity of other prime agricultural or existing open space lands.

The Project will be adjacent to other existing agricultural or open space lands for which the Project has been designed to address compatibility, including a buffer along the Adams Barranca to the west, and does not include uses such as residential, schools, and other sensitive receptors immediately adjacent to agricultural operations.

As shown, the proposed Project is consistent with factors (a) through (e).

3.3.5.2 Findings that Insufficient Non-Prime Agricultural or Vacant Land Exists

The Commission will not make affirmative findings that insufficient non-prime agricultural or vacant land exists within the boundaries of the agency unless the applicable jurisdiction has prepared a detailed alternative site analysis which at a minimum includes:

a. An evaluation of all vacant, non-prime agricultural lands within the boundaries of the jurisdiction that could be developed for the same or similar uses.

The proposed Project would develop approximately 54 acres of agricultural land. As discussed in **Section 4.10, Land Use**, of the Draft EIR, there is insufficient non-prime agricultural or vacant land within the City's existing boundaries that is planned and developable for the same general type of use.

The City conducted an inventory of vacant land conducted for the City's 2013–2021 Housing Element Update identified approximately 60 acres of vacant, properties within the current City limits, not including land in the City's East Area 1 and East Gateway Specific Plan areas. Those vacant sites are dispersed throughout the City, include sites zoned for residential uses, and do not provide sufficient contiguous land to allow for the orderly, efficient, and planned development of the commercial and light industrial uses envisioned for the Project area in the Santa Paula General Plan.

b. An evaluation of the re-use and redevelopment potential of developed areas within the boundaries of the jurisdiction for the same or similar uses.

The City completed an inventory of vacant land within the City limits for the City's 2013-2021 Housing Element Update. This inventory identified approximately 60 acres of vacant, residentially land, including several small vacant commercial properties, within the current city limits Those vacant sites are not contiguous, are dispersed throughout the City, and are not suitable for development with the type of light industrial and business park uses that would be accommodated by this proposed Project.

c. Determinations as to why vacant, non-prime agricultural lands and potential re-use and redevelopment sites are unavailable or undesirable for the same or similar uses, and why conversion of prime agricultural or existing open

space lands are necessary for the planned, orderly, and efficient development of the jurisdiction.

As discussed above, the City does not have sufficient land available within its current City limits to accommodate the light industrial uses this Project would allow. Four expansion areas, Adams Canyon, Fagan Canyon, West Area 2, and one planning area, East Area 2, are identified in the City's General Plan to accommodate needed growth. This proposed Project is located in the West Area 2 Expansion Area, which is the primary area planned to meet the City's need for additional light industrial land.

As shown, the proposed Project is consistent with factors (a) through (c).

3.3.5.3 Impacts on Adjoining Prime Agricultural or Existing Open Space Lands

In making the determination whether conversion will adversely impact adjoining prime agricultural or existing open space lands, the Commission will consider the following factors:

a. The prime agricultural and open space significance of the territory and adjacent areas relative to other agricultural and existing open space lands in the region.

Approximately 49 acres of the 54-acre Project Site are currently under agricultural cultivation

The Project Site includes 49.1 acres of land meeting the definition of prime agricultural land in Government Code Section 56064.

The Project Site contains approximately 44.20 acres of prime farmland, 4.88 acres of farmland of Statewide importance, and 4.48 acres of urban and built-up land as designated on the current State Important Farmland Map.

As of 2016, Ventura County had approximately 118,508 acres of important farmland, which included 40,976 acres of prime farmland and 32,992 acres of farmland of Statewide importance.¹⁰ The 44.20 acres of prime farmland and 4.88 acres of farmland of Statewide importance currently under agricultural cultivation within the Project Site account for 0.1 percent of the total prime farmland in Ventura County and 0.01 percent of the total of farmland of Statewide importance within the County.

Additionally, the land directly west of the Project Site is part of the Ventura-Santa Paula Greenbelt and will not annexed or developed. Annexation and development of the Project Site in accordance with the proposed Specific Plan, which includes a buffer to ensure compatibility with agricultural land

10 California Department of Conservation, Farmland Mapping and Monitoring Program, Ventura County, Land Use Conversion Table, <http://www.conservation.ca.gov/dlrp/fmmp/Pages/Ventura.aspx>.

around the site will not affect the large amount of remaining high quality agricultural land in the County.

b. *The economic viability of the prime agricultural lands to be converted.*

The Project Site is currently farmed by two organizations: Bender Farms and McGrath Farms. Bender Farms grows avocados on approximately 9.2 acres of land and herbs on approximately 12.3 acres. McGrath Farms grows a variety of row crops on approximately 27.5 acres of land. The proposed Project contains 44 acres of prime agricultural land that would be converted. The County of Ventura has determined that prime agricultural lands in the County are highly productive and are capable of supporting commercially viable agricultural operations on parcels as small as 9 acres.¹¹ At 44 acres, continued agricultural operations are economically viable.

c. *The health and well-being of any urban residents adjacent to the prime agricultural lands to be converted.*

The health and well-being of urban residents adjacent to the proposal area are unlikely to be impacted as a result of the conversion of the agricultural land within the proposed SOI amendment. The existing residential development to the north is separated by Telegraph Road, which has a width of approximately 50 feet, from the Project Site. The proposed light industrial and business park uses would be developed in accordance with the development and design standards in the proposed Specific Plan, will be compatible with the nearest residential uses, and will not affect the health or well-being of the residents of this neighborhood

d. *The use of the territory and the adjacent areas.*

Residential and agricultural uses surround the Project Site. To the north of the Project Site and Telegraph Road are primarily single-family residences accessed from Country View Court, as well as a mobile home park accessed from Valencia Way. The southern portion of the Project Site is bound by SR 126; just beyond the freeway exist agricultural uses that grow various row crops, avocados, and citrus, and contain a limited number of single-family residential units within some of the properties. To the east of the Project Site, along Beckwith Road, are light industrial uses to the east, including offices, warehouse buildings, construction equipment storage, and maintenance facilities. The Adams Barranca is located adjacent to the western boundary of the Project Site; agricultural uses and limited single-family residences, consisting of orchards and a limited number of livestock, are located immediately west of the Adams Barranca.

Similar industrial uses currently exist to the east of the Project boundary. Additionally, man-made or natural boundaries would separate uses from the north, south, and west portions of the Project Site. The proposed light

11 Ventura County Land Conservation Act Guidelines. Adopted November 22, 2011; December 8, 2015, edition.

industrial and business park uses would be developed in accordance with the development and design standards in the proposed Specific Plan, will be compatible with the surrounding uses.

e. Whether public facilities related to the proposal would be sized or situated so as to facilitate the conversion of prime agricultural or existing open space land outside of the agency's sphere of influence, or will be extended through prime agricultural or existing open space lands outside the agency's sphere of influence.

The City has sewer and water master plans designed to serve uses allowed by the City's General Plan, including the uses in the West Area 2 Expansion Area, which includes the Project Site. Sewer and water facilities would be provided to serve the site consistent with these master plans and would not be sized to accommodate additional growth. The Project would also not involve any road improvements that could induce growth of adjacent agricultural or open space land.

f. Whether natural or man-made barriers serve to buffer prime agricultural or existing open space lands outside of the agency's sphere of influence from the effects of the proposal.

The west portion of the Project Site will have a buffer between the Adams Barranca and the proposed Project, which will create a buffer between the existing prime agriculture to the west and the proposed Project Site. Additionally, Faulkner Road, and the 126 Freeway, places a buffer between the proposed Project and the agricultural land to the south of the Project Site.

g. Applicable provisions of local general plans, applicable ordinances that require voter approval prior to the extension of urban services or changes to general plan designations, Greenbelt Agreements, applicable growth-management policies, and statutory provisions designed to protect agriculture or existing open space.

The affected territory is not subject to voter approval for the extension of services or for the proposed minor changes in existing City General Plan land use designations. The proposed Specific Plan would include the annexation of land located within the City's voter approved CURB. Measure L6 is not triggered by the proposed Project.

h. Comments and recommendations by the Ventura County Agricultural Commissioner.

No comments or recommendations directly involving the Project were received from the Agricultural Commissioner. In addition, the Project is consistent with the Agricultural Policy Advisory Committee's Agricultural/Urban Buffer Policy, which requires new dwellings, nonagricultural work sites, and ongoing outdoor public activities that may potentially conflict with agricultural operations to include a buffer/setback

and fencing. The proposed Project will provide a buffer zone adjacent to the Adams Barranca to the west and is separated from adjacent lands by existing roadways (Faulkner Road to the south, Beckwith Road to the east, and Telegraph Road to the north).

As shown, the proposed Project does not conflict with factors (a) thru (h).

3.3.5.4 Territory Subject to a Land Conservation Act (Williamson Act) Contract

LAFCo will not approve a proposal which includes the annexation of territory subject to an active Land Conservation Act contract to a city or special district that provides or would provide facilities and/or services other than those that support the land uses that are allowed under the contract. For purposes of this section, an active Land Conservation Act contract includes a contract for which a notice of non-renewal has been filed.

The proposed Project is consistent with Policy 3.3.5.4. The proposed Project does not contain any parcels subject to a Williamson Act contract.

Section 4.11, Noise

Page

Revision:

4.11-16-17

Santa Paula Municipal Code

Annexation of the Santa Paula West Business Park into the City of Santa Paula is planned to occur as part of the Specific Plan approval process. Santa Paula Municipal Code (SPMC) Chapter 93 sets noise standards for the City. SPMC Section 93.21 establishes the acceptable exterior noise standard for residential uses of 65 dB(A) from 7:00 AM through 10:00 PM, and of 60 dB(A) from 10:00 PM through 7:00 AM. The exterior noise standard for other noise-sensitive uses, including schools, libraries, hospitals, community care facilities, and assembly halls, is 65 dB(A) at all times. According to the SPMC, commercial and office uses cannot exceed an outdoor noise level of 70 dB(A), and neighborhood commercial uses cannot experience an external noise level of more than 65 dB(A). Industrial uses cannot to exceed an external noise level of more than 75 dB(A). The SPMC ~~does~~ has not yet set acceptable interior noise level standards.

4.11-24

Project Impacts

As previously discussed, an increase of 3 dB(A) or greater in traffic noise levels that occurs from Project-related activities would be considered significant if the resulting noise levels that occurs from Project-related activities would exceed the

City Noise Compatibility Matrix for “acceptable” exterior or interior noise levels. These roadway systems ~~will do~~ not experience an increase in noise levels of 3 dB(A) or greater. In addition, vehicle trips and traffic noise levels would remain the same with the proposed Beckwith Road extension and would not cause an increase of 3 dB(A) or greater due to Project-related activities. Therefore, the Santa Paula West Specific Plan Area would not result in significant noise impacts in the local and regional street system. Impacts along these roadway systems are considered less than significant.

4.11-25**Project Impacts**

As mentioned previously, exterior-to-interior reduction of noise is generally 25 dB(A) or more. Assuming noise levels at 69.4 dB(A) within 50 feet from the railway centerline, interior noise ~~could~~will be reduced to 44.4 dB(A), below the General Plan noise threshold of 45 dB(A), in compliance with the City’s Building Code. Therefore, potential interior noise within the proposed development would be considered less than significant.

4.11-26**Project Impacts**

Loaded trucks and large bulldozers are capable of producing approximately 86 and 87 VdB, respectively, at 25 feet. The surrounding land uses within 25 feet of the Project Site include the scattered residential uses immediately to the west. The construction near this portion of this site may include some earthwork and grading activities. While offsite surrounding land uses may experience vibration events, these would be temporary and would not be frequent and impacts would be considered less than significant.

4.11-29**Project Impacts**

~~Average daily trips associated with construction activities would not result in a doubling of trip volume along study-area roadways. Given that it takes a doubling of average daily trips on roadways to increase noise by 3 dB(A), the average daily trips associated with construction activities would not result in a doubling of trip volume along study-area roadways.~~ the n Noise-level increases associated with construction vehicle trips along major arterials in the City of Santa Paula and nearby roadways that are within the area (unincorporated County of

Ventura) would be less than 3 dB(A), and potential impacts will be less than significant.

Section 4.12, Public Services

4.12-16 Project Impacts

~~Furthermore, as part of the review of the Specific Plan, the City of Santa Paula and Project Applicant will enter into a Development Agreement with the property owner that addresses the funding of public services, including fire protection services. Under the terms of the Development Agreement, the Project Applicant and/or developer will be required to contribute funding through development impact fees to the City to contribute toward ongoing fire protection facilities and personnel costs. No new facilities would be required to serve the Project Site as a result of the implementation of the Specific Plan. As such, mitigation is not required.~~

4.12-18 Cumulative Impacts

The City has regulations and ordinances in place to address impacts on public services (e.g., police, fire), including the provision and acquisition of new facilities and equipment. All planned development would be reviewed by the respective agencies and corresponding mitigation design features and payment of existing fees would be required prior to building permit issuance. Therefore, cumulative impacts associated with public services would be less than significant.

Section 4.13, Transportation and Traffic

Page Revision:

4.13-26 Project Impacts

The summary of the freeway and multilane highway impacts analyses is provided in **Table 4.13-6, Existing plus Project Impacts—Freeway and Multilane Segments**. The five freeway segments currently operate at LOS C or better in both directions. Based on the significance threshold for the Los Angeles County CMP, the Project ~~does~~ will not operate at LOS F after the addition of project traffic and the Project does not cause a net increase in traffic demand of 2 percent of

capacity or more. Therefore, the Project would result in less than significant impacts to freeway and multilane segments.

4.13-27 **Project Impacts**

The City's General Plan includes goals to ensure that City residents have alternative transportation opportunities, such as public transit, bikeways, and pedestrian routes.

4.13-39 **Mitigation Measures, MM TRA-1**

Peck Road & Harvard Boulevard/Telegraph Road/Main Street (Intersection 8).

This intersection could be mitigated to LOS C or better with the addition of one travel lane to both the northbound and southbound approaches on Peck Road and the addition of a northbound right overlap phase. The northbound lane configuration would be one right-turn lane, two through lanes, and one left-turn lane. The northbound right-turn movement would also have an overlap signal head installed to accommodate the overlap phase. The southbound lane configuration would be one shared through/right-turn lane, one through lane, and one left-turn lane.

Since this is a cumulative impact, the Project applicant ~~would~~ shall be responsible for their fair share contribution for this mitigation improvement.

4.13-40 **Mitigation Measures**

10th Street & Harvard Boulevard (Intersection 1) – No feasible ~~MM~~ mitigation measures are ~~from prior major projects in Santa Paula were investigated along the Ojai Road corridor available~~. A beautification project including bicycle lanes is planned along 10th Street at this location; therefore, widening of 10th Street to gain capacity was not considered as a ~~possible~~ physically feasible mitigation. Given the constraints of the intersection and the proposed bicycle lanes, cumulative impacts to this intersection cannot be fully mitigated. Alternatively, a peak-hour parking restriction on the southbound approach would allow for the reconfiguration of the southbound approach to include on shared through/right turn lane, one through lane (during peak hours), and on left-turn lane. The northbound approach could be restriped to provide one right-turn lane, one through lane, and one left-turn lane. In combination, these measures would

result in an improvement from LOS C during the AM peak hour and LOS D during the PM peak hour to LOS A during the AM peak hour and LOS B under the PM peak hour, thus mitigating the increase in V/C ratio attributable to project traffic. However, due to the planned bicycle lanes, these improvements mitigations were not considered as to be a feasible mitigation measure.

4.13-29

Mitigation Measures

10th Street & Harvard Boulevard (Intersection 1) – No feasible Mmitigation measures are ~~from prior major projects in Santa Paula were investigated along the Ojai Road corridor available.~~ A beautification project including bicycle lanes is planned along 10th Street at this location; therefore, widening of 10th Street to gain capacity was not considered as a ~~possible~~ physically feasible mitigation. Given the constraints of the intersection and the proposed bicycle lanes, cumulative impacts to this intersection cannot be fully mitigated, and the impact would remain significant and unavoidable. Alternatively, a peak-hour parking restriction on the southbound approach would allow for the reconfiguration of the southbound approach to include one shared through/right-turn lane, one through lane (during peak hours), and one left-turn lane. The northbound approach could be restriped to provide one right-turn lane, one through lane, and one left-turn lane. In combination, these measures would result in an improvement from LOS C during the AM peak hour and LOS D during the PM peak hour to LOS A during the AM peak hour and LOS B during the PM peak hour, thus mitigating the increase in V/C ratio attributable to project traffic. However, due to the planned bicycle lanes, these mitigations were not considered as a feasible mitigation. The constraints of the intersection and the proposed bicycle lanes discussed under the Existing plus Project scenario would also apply to the Cumulative plus Project scenario. Therefore, this intersection cannot be fully mitigated, and the impact would remain significant and unavoidable.

Section 4.14, Utilities and Service Systems

Section 4.14, Utilities and Service Systems, of the Draft EIR was updated to reflect the Final Water Supply Assessment for the Proposed Santa Paula West Business Park Specific Plan Project (Final WSA). The Final WSA was updated to reflect the Final 2016 Urban Water Management Plan (UWMP) released in August 2017. The 2016 UWMP had many updates but specially there were, updated generation rates, updated current and future supplies and demands through 2040, and updated water production, recycled water, groundwater allocations and transfers. Due to the updated UWMP, many changes were made to the

water portion of the Utilities and Service Systems. This section can be found with strike throughs for deletions and double underlines for insertions in **Appendix A**. The changes largely consist of changes to water supply and demand numbers; changes to **Tables 4.14-1** through **4.14-4**, **4.14-6**, and **4.14-10**; and updating references to the 2016 Final UWMP.

Section 5.0, Alternatives

Section 5.0, Alternatives, of the Draft EIR was updated to reflect grammar and minor technical errors. The following changes were made:

<u>Page</u>	<u>Revision:</u>
5.0-2	<p>Project Objectives</p> <p>1. Help revitalize the existing built environment and economic climate of the City by permitting new investment and development in West Area 2 that reflects and complements the existing pattern and scale of development in Santa Paula, <u>as envisioned in the City's General Plan</u>;</p>
5.0-9	<p>Conclusion and Relationship to Project Objectives</p> <p>Land use and water usage impacts for the proposed Project would be significantly fewer <u>less</u> than those under the No Project–No Development Alternative. While this alternative would not generate any impacts to water or land use, the impacts of this alternative could be considered greater than the proposed Project.</p>
5.0-9	<p>Alternative 2: 25 Percent Reduction, Description of Alternative</p> <p>This alternative assumes that there would be a 25 percent reduction in the 53.81 acres that makes up the proposed Project. This assumes that 75 percent, or approximately 40.36 acres of the Project would be built with the Specific Plan <u>area</u>, and 25 percent, or approximately 13.45 acres would remain under the jurisdiction of the County of Ventura with land use subject to the County's General Plan and zoning, and agricultural operations would still continue.</p>
5.0-13	<p>Cultural Resources</p> <p>This alternative would develop a smaller portion of the site with commercial and light industrial uses. This alternative would have a similar potential to uncover previously unknown archaeological resources and human remains. Compliance</p>

with the Mitigation Measures during the construction phase would ensure development would not result in significant impacts to potential cultural resources. Impacts would be similar to those of the proposed Project, and less than significant.

5.0-13-14

Greenhouse Gas

The proposed Project would generate a net increase of approximately 5,546 ADT while 4,160 ADT could be generated under Alternative 2. As with the proposed Project, GHG emissions would be generated by area, energy, and mobile sources, waste disposal, and water and wastewater treatment and conveyance, with mobile sources generating the majority of the overall GHG emissions. All industrial land use projects that exceed 10,000 MTCO₂e per year are considered potentially significant under the South Coast Air Quality Management District (SCAQMD) screening threshold, which is recognized by the VCAPCD. The estimated Project operational GHG emissions with project design features was estimated to be 6,674.83 MTCO₂e per year, which would not exceed the screening threshold. Given that Alternative 2 includes a 25 percent reduction in uses, this alternative would result 5,006 MTCO₂e per year, which would not exceed the screening threshold. In addition, as with the proposed Project, development under Alternative 2 is expected to be consistent with all feasible and applicable strategies and the recommended measures of ARB Scoping Plan to reduce greenhouse gas emissions in California. Neither this alternative nor the proposed Specific Plan would result in significant greenhouse gas impacts; however, impacts under this alternative would be slightly ~~fewer~~ less.

5.0-14

Hazards and Hazardous Materials

While this alternative would result in a density reduction to approximately 40 acres, development would still occur; and impacts similar to those of the proposed Project, but at a reduced intensity, would occur. Construction of the Project would still require materials that could contain hazardous materials, such as fuels, solvents, oils, coatings, etc. that could spill or release. Additionally, agricultural land containing residual pesticides, would still be disturbed. Mitigation measures pertaining to these issues would still be implemented and impacts would be similar to that of the proposed Project, and less than significant.

5.0-15**Public Services**

Without annexing approximately 13 acres to the City of Santa Paula, the City's municipal services needs would slightly decrease. However, there would still be a demand for the City's police, fire, and other City resources. Because there is no residential development involved, public schools and parks would not be impacted under this alternative. Similar to the proposed Project, the Project Applicant and/or developer will be required to contribute funding through development impact fees to the City to contribute toward ongoing fire protection and police services. Impacts would be similar to those of the proposed Project, and less than significant. ~~There would be similar, less than significant impacts under Alternative 2 as the proposed Project.~~

5.0-17**Conclusion and Relationship to Project Objectives**

A summary comparison of impacts associated with the Project alternatives is provided in **Table 5.0-3** at the end of this section.

The 25 Percent Reduction Alternative would reduce impacts to agricultural resources, air quality, greenhouse gas, transportation and traffic, wastewater, solid waste, and stormwater when compared to the proposed Project. However, significant and unavoidable impacts would not be avoided or substantially lessened. Land use impacts would be greater because this alternative would be potentially inconsistent with the goals and objectives of the General Plan Land Use Element, specifically, objective 5(f), "Sufficient land should be provided for all uses, including parks, low-density residential, industrial and neighborhood commercial, to accommodate projected population growth to the year 2020."~~The 25 Percent Reduction Alternative would result in reduced impacts when compared to the proposed Project. Land use is considered to be greater as it would create an unincorporated island and the general plan would not be fully implemented.~~

This alternative would meet the basic objectives defined by the City of Santa Paula for the proposed Project, but to a lesser degree.

5.0-17-5.0-18**Alternative 3: 50 Percent Reduction, Description of Alternative**

Alternative 3 assumes that there would be a 50 percent reduction in the 53.81 acres that makes up the proposed Project. This assumes that 50 percent, or

approximately 26.90 acres of the Project would be built with the Specific Plan area, and 50 percent, or approximately 26.90 acres would remain under the jurisdiction of the County of Ventura with land use subject to the County's General Plan and zoning, and agricultural operations would still continue.

5.0-20 Cultural Resources

This alternative would develop a smaller portion of the site with commercial and light industrial uses. Alternative 3 would have a similar potential to uncover previously unknown archaeological resources and human remains. Compliance with the Mitigation Measures during the construction phase would ensure development would not result in significant impacts to potential cultural resources. Impacts would be similar to those of the proposed Project, and less than significant.

5.0-21 Hazards and Hazardous Materials

While this alternative would result in a density reduction to approximately 27 acres, development would still occur; and impacts similar to those of the proposed Project, but at a reduced intensity, would occur. Construction of the Project would still require materials that could contain hazardous materials, such as fuels, solvents, oils, coatings, etc. that could spill or release. Additionally, agricultural land containing residual pesticides, would still be disturbed. Mitigation measures pertaining to these issues would still be implemented and impacts would be similar to that of the proposed Project, and less than significant.

5.0-22 Public Services

Without annexing approximately 27 acres to the City of Santa Paula, the City's municipal services needs would slightly decrease. However, there would still be a demand for the City's police, fire, and other City resources. Because there is no residential development involved, public schools and parks would not be impacted under this alternative. Similar to the proposed Project, the Project Applicant and/or developer will be required to contribute funding through development impact fees to the City to contribute toward ongoing fire protection and police services. Impacts would be similar to those of the proposed Project, and less than significant. ~~There would be similar, less than significant impacts under Alternative 2 as the proposed Project.~~

5.0-24

Conclusion and Relationship to Project Objectives

A summary comparison of impacts associated with the Project alternatives is provided in **Table 5.0-3** at the end of this section.

The 50 Percent Reduction Alternative would result in reduced impacts to aesthetics, agricultural resources, air quality, biological resources, greenhouse gases, noise, transportation and traffic, wastewater, solid waste, and stormwater when compared to the proposed Project, and would avoid the significant and unavoidable traffic impact of the proposed Project at one intersection. Land use impacts would be greater because this alternative would be potentially inconsistent with the goals and objectives of the General Plan Land Use Element, specifically, objective 5(f), "Sufficient land should be provided for all uses, including parks, low-density residential, industrial and neighborhood commercial, to accommodate projected population growth to the year 2020."

~~The 50 Percent Reduction Alternative would result in reduced impacts when compared to the proposed Project, and avoid would avoid the significant and unavoidable impact of the proposed Project on transportation and traffic at one intersection. Land use impacts are considered to be greater because the general plan would not be fully implemented.~~

This alternative would meet the basic objectives defined by the City of Santa Paula for the proposed Project, but to a lesser degree.

5.0-25

Environmentally Superior Alternative

Alternative 1, the No Project Alternative, would have the fewest impacts and would not result in any significant impacts making it ~~and is~~ the environmentally superior alternative. However, the No Project Alternative would not meet the objectives of the proposed Project. As noted above, if the No Project Alternative is determined to be environmentally superior, the CEQA Guidelines require an environmentally superior alternative must also be identified among the remaining alternatives.

The environmentally superior alternative among the remaining alternatives would be ~~the~~ Alternative 3, the 50 Percent Reduction Alternative. This alternative would avoid the significant and unavoidable environmental impact identified at one intersection ~~under traffic for the proposed Project.~~

However, this alternative would not eliminate the significant and unavoidable impacts for aesthetics, agricultural resources, and air quality during construction; ~~and~~ would not be consistent with applicable land use policies; and would not achieve the basic objectives of the Project as defined by the City of Santa Paula. Additionally, water usage would be greater by approximately 120.6 afy when compared to the build-out of the proposed Project because of higher water use for existing agriculture.

5.0-25-26

Table 5.0-3 Comparison of Alternatives to the Proposed Project

	Proposed Project	Alternative 1	Alternative 2 No Project Existing Plans & Policies	Alternative 3 East Gateway Specific Plan & High Density Residential
Environmental Topic	Impacts with Mitigation	No Project Alternative	<u>25 Percent Reduction</u>	<u>50 Percent Reduction</u>

APPENDIX A

Revisions to Draft EIR—Utilities

4.14 UTILITIES AND SERVICE SYSTEMS

This section describes the existing utilities and service systems located on and immediately surrounding the Santa Paula West Business Park Specific Plan (“Specific Plan”) area. The section addresses the potential impacts of the Project on water service, sewer service, and solid waste. Each subsection includes an introduction, followed by discussions of existing conditions, regulatory framework, methodology, potential environmental impacts, cumulative impacts, and recommended mitigation measures to help reduce or avoid identified impacts, and the level of significance of adverse impacts after mitigation.

Information presented in this section derives from the City of Santa Paula’s General Plan (1998), the City of Santa Paula’s ~~Draft-Final~~ *Water Supply Assessment for the Proposed Santa Paula West Business Park Specific Plan Project* (“~~Draft-Final~~ WSA”; ~~November 2016~~), the Final 2016~~0~~ Urban Water Management Plan (UWMP) Update (~~June 2011~~ August 2017), the 2005 Potable Water System Master Plan Amendment (June 2012), the Wastewater System Master Plan (2012), the *Sanitary Sewer Technical Report* prepared by Jensen Design & Survey, Inc. (May 2015), CalRecycle, well-pumping data through year 2014, and the proposed Santa Paula West Business Park Specific Plan (October 2016). The ~~Draft-Final~~ WSA is included in **Appendix 4.14**.

4.14.1 EXISTING CONDITIONS

Water

On-Site Water Availability

The Project Site currently contains two small farmworker dwelling units that use potable water and approximately 49 acres under agricultural production that also use water for irrigation. The remainder of the Project Site consists of nonirrigated open space and improvements such as roads and equipment storage areas associated with farming operations.

Within the Santa Paula Groundwater Basin, water for the Project Site is currently provided by an on-site water well that supplies water for existing agricultural irrigation uses and for domestic consumption (residents). This existing water well also provides water for off-site users other than those on the Project Site. This existing well has been in service for a long period of time and, for the purposes of future conditions, has run its design life.

Water Demand

The City's water distribution system provides domestic water service to approximately ~~7,278~~ 400 end users/accounts.¹ As provided in **Table 4.14-1, 2015~~0~~ City Water Demand**, the total 2015~~0~~ water demand within the City was ~~4,416~~ 3,907 acre-feet (af).² The largest land use in the City for water demand is single-family residential, which accounted for approximately ~~54~~ 7 percent of the total 2010~~5~~ water demands. Multifamily residential accounts represented approximately ~~22~~ 0 percent of the 2015~~0~~ demands. Commercial/Institutional accounts represented approximately ~~13~~ 4 percent of the 2015~~0~~ demands. Industrial, landscape and agricultural-irrigation, sales to Middleroad Mutual Water Company, estimated losses/unmetered, and "other" accounts represented the balance of the demands.

Table 4.14-1
2015~~0~~ City Water Demand

Customer Classification	Demand (acre-feet)	Percent of Total Water Demand
Single-family residential	2,504 <u>106</u>	56.7 <u>54</u>

Total	4,416 <u>3,907</u>	100.00

Source: City of Santa Paula, Final ~~2016~~ 2010 Urban Wastewater Management Plan (UWMP) Update, ~~June 2011~~ (August 2017), Table 3-1, ~~42~~.

The City does not generally provide wholesale water to any other agencies, nor does it purchase water from any wholesale agency. However, in 2010~~5~~, the City provided ~~44~~ 39 af to the Middleroad Mutual Water Company.³ The City does not use potable supplies for saline barriers, groundwater recharge, conjunctive use, raw water, or recycled water uses.

The 2016~~0~~ UWMP Update includes estimated future water demand based on the City's General Plan (see **Table 4.14-2, Estimated Future Potable Water Demand**).⁴ Future water requirements are estimated

Note: afy = acre-feet per year.

Water Supply

The City of Santa Paula (City) Public Works, Water Division, supplies water to the City. The City of Santa Paula currently has secured water rights from two sources: groundwater allocation from the Santa Paula Basin, and surface water through an agreement with the Canyon Irrigation Company. Currently the Santa Paula Basin is the City’s sole source of water supply.⁵

The total amount of water produced by the City was 4,455,907 af in 2010~~05~~. In comparison, the City produced 5,046,047 af in 2005, ~~an amount that is 591 af more than was produced in 2010~~ which is 29

⁵ City of Santa Paula, Final 2016~~2010~~ UWMP Update (August 2017), ~~June 2011~~ August 2017), 55.

greater than production in 2015. The highest annual water demand for the period 2000 to ~~2010~~2015 was recorded in 2002, when 5,359 af was produced.⁶

The City's current groundwater supply includes production from five active wells. Domestic water is pumped from Wells 1-B, 11, 12, 13, and 14, which can produce up to 10.6 million gallons per day.⁷ **Table 4.14-4, City Groundwater Well Production**, summarizes the City's groundwater resources by well, including current status, well capacity, and 2010~~5~~ production. Wells 12 and 14 produced ~~81~~98 percent of the water for the City in ~~2010~~2015. The City no longer operates Wells 2, 8, and 9 because of a history of elevated nitrate levels in water extracted from these sources; these wells were sold to an agricultural enterprise.

6 City of Santa Paula, Final 2016 UWMP Update (August 2017), 63.

7 City of Santa Paula, Final 2016-2019 UWMP Update (June 2011-August 2017), 266.

**Table 4.14-4
City Groundwater Well Production**

Well No.	Status	Capacity (gpm)	2010 Production (acre-feet)

12	Active	<u>1,448,179</u>	<u>1,768.8527</u>
13	Active	<u>1,932,042</u>	<u>353.3378</u>
14	Active	<u>3,219,375</u>	<u>1,825.3507</u>
Total			<u>4,455.53,907</u>

Source: City of Santa Paula, Final 2016 ~~2010~~ UWMP Update (~~June 2011~~ August 2017), Table 4-32, p. 63.

The Project Site is located outside of the incorporated City boundary but is within West Area 2, which is a future expansion area under the City's General Plan, and is within the City's Sphere of Influence. The entire Project Site would be located within the City's service area after annexation of the site to the City.

Construction of the City's centralized water conditioning facility and the Well 14 pumping plant was completed in 2000. The centralized water conditioning facility was designed to remove manganese and iron from up to 10 million gallons of water per day from Wells 11, 13, and 14, and future Well 15. Well 14 is anticipated to contribute an added 4.5 million gallons of water per day to the system. This added production capacity will help the City's water system to meet peak water use demands in hot summer weather. Both facilities are housed in a new building located along Main Street. Well 1-B was recently rehabilitated. Annual production from existing and planned wells will be limited by the City's current groundwater allocation (5,412 acre-feet per year [afy]) in the Santa Paula Basin.

There are several options that the City may consider for meeting future water demands including: long-term transfer of water rights; short-term transfer of water rights; State Water Project (SWP) water; use of recycled water; and supporting water demand management programs.⁸ Implemented over time, these programs are expected to provide the City with sufficient supplies to meet future water demands.

Water Supply Assessment

A ~~Draft~~ Final WSA was prepared for the Specific Plan in accordance with the requirements of Section 10910 of the California Water Code (Senate Bills [SB] 610 and 221) to verify the sufficiency of the local

⁸ City of Santa Paula, Final 2016-2010 UWMP Update (~~June 2011~~ August 2017), 1.

water supply to meet the demand associated with the land uses allowed under the Specific Plan.⁹ The ~~Draft-Final~~ WSA, included in **Appendix 4.14**, considered water supplies for the entire 53.81-acre Specific Plan area and specifically for the areas of light industrial, commercial, and landscaped areas that would be allowed for development under the Specific Plan. The ~~Draft-Final~~ WSA also considered the Project water demand in light of the existing water demand for the agriculture and related uses currently on the Project Site.

The ~~Draft-Final~~ WSA reported the 20-year water supply and demand estimates from the City's 2016~~0~~ UWMP, prepared in 2011. ~~the final 2017 document was prepared in~~ accordance with California Water Code Sections 10610 and 10656. The ~~Draft-Final~~ WSA concluded that there would be no decrease in availability of groundwater supplies through the year 2037~~40~~. Furthermore, the ~~Draft-Final~~ WSA determined that the City of Santa Paula's projected water supply for 20 years is adequate to meet the demand for the Project, as well as existing and planned future uses in the City in normal, single dry, and multiple dry years.

Section 15155 (d) of the California Environmental Quality Act (CEQA) Guidelines states that when a WSA has been prepared for a project, no additional WSA is required if the water demands of the project have not substantially increased and there have been no changes in circumstances or conditions that would substantially affect the ability of City to supply the water needed for the project.

The Specific Plan ~~Draft-Final~~ WSA provided water demand estimates for the City of Santa Paula through 2037~~2040~~, which corresponded with the 20-year forecast required in a WSA if the Project were to be initiated in 2017. The 2016~~0~~ UWMP addresses new requirements developed by the State of California Department of Water Resources (DWR) as published in their *Guidebook to Assist Urban Water Suppliers to Prepare a 2016 Urban Water Management Plan* ~~2010 Urban Water Management Plan~~ (March 2011~~August 2017~~).

On January 17, 2014, the Governor of the State of California proclaimed a state of emergency due to current drought conditions and called on Californians to reduce their water usage by 20 percent. On March 1, 2014, the Governor signed into law emergency drought legislation that finds and declares that California is experiencing an unprecedented dry period and shortage of water for its citizens, local governments, agriculture, environment, and other uses.

⁹ City of Santa Paula, *Draft Water Supply Assessment for the Proposed Santa Paula West Business Park Specific Plan Project* (November 2016).¹⁰ State of California, Office of Administrative Law, OAL File No. 2015-0506-02 EE, Notice of Approval of Emergency Regulatory Action, State Water Resources Control Board (May 18, 2015). http://www.waterboards.ca.gov/waterrights/water_issues/programs/drought/docs/emergency_regulations/oal_approve_d_regs2015.pdf.

Additionally, the Fox Canyon Groundwater Management Agency (GMA), the local agency responsible for groundwater management for aquifers on the Santa Paula Basin, adopted an emergency pumping ordinance (Emergency Ordinance E) on April 11, 2014, that implements a phased 20 percent reduction over 18 months, consistent with Governor Brown's January 2014 drought declaration, other agencies' efforts, and the GMA's need to achieve groundwater basin sustainability.

On December 22, 2014, Governor Brown issued Executive Order B-28-14, which extended the suspension of certain activities subject to the CEQA contained in the January 2014 and April 2014 proclamations, including the State Water Resources Control Board's (SWRCB's) adoption of emergency regulations pursuant to Water Code section 1058.5, through May 31, 2016. On March 17, 2015, the SWRCB adopted an expanded emergency conservation regulation prohibiting certain irrigation practices, restricting certain commercial activities, and ordering all urban water suppliers to implement mandatory restrictions on outdoor irrigation. The emergency regulation orders larger urban water suppliers (i.e., those providing water for municipal purposes to more than 3,000 customers or supplying more than 3,000 af of water annually, excluding wholesalers) to provide monthly data on water production, enforcement, and outdoor water conservation measures being implemented.

On April 1, 2015, Governor Brown signed Executive Order B-29-15, directing the SWRCB to impose restrictions to achieve a statewide 25 percent reduction in potable urban water usage through February 2016, as compared to the amount used in 2013. The Governor instructed the SWRCB to consider the relative per capita water usage of each supplier's service area and to require those areas with high per capita use to achieve proportionally greater reductions than those with low use. The order mandates that the Governor's January 2014 proclamation, April 2014 proclamation, Executive Order B-26-14, and Executive Order B-28-14 remain in full force and effect except as modified.

On May 5, 2015, the SWRCB adopted an emergency conservation regulation in accordance with the Governor's directive. The provisions of the emergency regulation went into effect on May 18, 2015. The emergency regulation identifies how much water communities must conserve based on their average residential water use, per person per day, last summer. Every person should be able keep indoor water use to no more than 55 gallons per day. For the most part, the amount of water that each person uses in excess of this amount is water that is applied to lawns and other ornamental landscapes.

To reduce water use by 25 percent statewide, a regulation adopted by the SWRCB places each urban water supplier into one of eight tiers, each of which is assigned a conservation standard ranging between 4 and 36 percent.¹⁰

As of March 2016, the City of Santa Paula had a Conservation Standard of 26 percent as directed by the SWRCB; from March to June 2016, the City achieved 24.2 percent water savings. The Governor issued a new Executive Order, as of June 1, 2016, reducing the Conservation Standards as a result of improved conditions, and the City now has a zero percent conservation standard.¹¹

In September 2016, Governor Brown signed SB 1262 (Pavley). Details of this bill are discussed below under Regulatory Setting. It should be noted here, however, that SB 1262 is not effective until January 2017.

Project Site Water Supply and Demand

The existing land uses within the Specific Plan area includes approximately 54 acres of agricultural land, fallow agricultural land, and a small amount of industrial uses.

Water supply for irrigation on the Specific Plan area has been historically supplied from an on-site well that overlies the Santa Paula Basin. The existing well in the area (E11S) is owned and operated by McGaelic Group and Bender combined.

Approximately 49 acres of the Santa Paula West Specific Plan site is under cultivation for avocados, herbs, and a variety of row crops. Production records for the irrigation well for the period 2010 to 2014 are shown on **Table 4.14-5, Existing Well Pumping Records 2010–2014**. Water usage has been from one well but delivered to several parcels, including McGaelic West (McGrath owners), Bender Farms, and Jaime Santana; only the McGaelic West and Bender parcels are within the Project Site. As shown on Table 4.14-5, over the last five years (2010 to 2014), the total water used on site has averaged 281.1 afy.

Groundwater Allocation Transfers from Developed Properties

In accordance with Santa Paula Municipal Code Section 52.021, landowners or developers are required to transfer their groundwater rights to the City as a condition of project approval. This regulation is intended to ensure that new urban land users provide sufficient water resources for their needs. If the associated water rights are not sufficient to serve the proposed development’s anticipated water use (as determined by the City), or if the water rights are held by another entity who cannot or will not dedicate those rights to the City, the developer must either purchase additional water rights and dedicate them to the City or pay a water resource in-lieu fee to the City. This regulation applies to developments inside and outside City limits that seek to receive potable water service from the City.

Purchased Groundwater Allocations

Water availability is complicated by the fact that the actual safe yield of the Santa Paula Groundwater Basin is unknown.¹² Disagreement over the issue between the UWCD and the water users, including the City and the City of San Buenaventura (Ventura), led to the adjudication of the Santa Paula Groundwater Basin. The Stipulated Judgment¹³ represents the beginning of a program of basin management, including the regulation of pumping, that is aimed at meeting the reasonable water supply needs of the parties, including protection for historic users, without harm to the Santa Paula Groundwater Basin.

The 2010~~6~~ UWMP recognizes that in 2005, it was determined that 497 afy of potentially available groundwater allocations held by others within the Santa Paula Basin boundary were not being utilized as shown in **Appendix 4.14**.¹⁴ The City has the option to independently pursue the acquisition of groundwater allocations at any time in the future.

Source: City of Santa Paula, Final 2016¹⁰ Urban Water Management Plan Update (June 2014-August 2017).

* Projected data.

** Data taken from 2020 data.

*** 2015 Data taken from Final 2016 UWMP (August 2017).

Notes:

All values rounded to the nearest 1 acre-foot (af).

Santa Paula West Area Business Park Specific Plan would start construction in 2017 and be completed by 2027. Conservatively assumed full build-out Project Demand numbers in 2017.

afy = acre-feet per year.

¹ The City's current allocation is 5,488 afy (California, 2011; Frank B. and Associates, 2016).

² The City currently wheels the 500 afy of surface water from Santa Paula Creek to Farmers Irrigation Company, which uses the surface water in lieu of pumped groundwater, and the City gains 500 afy groundwater pumping credits in the Santa Paula Basin.

³ The City anticipates receiving 1,816 afy of groundwater allocation transfers via agricultural land development by 2040. For planning purposes, the 1,816 afy is distributed equally from 2020 to 2040. Note that the method for dividing up groundwater allocations through the years was done differently in the 2016 Draft UWMP than in the 2010 Final UWMP, where allocation transfers were achieved during four equal 5-year periods (approximately 454 afy per 5-year period).

⁴ The City anticipates purchasing 497 afy of additional groundwater allocations by 2040. For planning purposes, the 497 afy is distributed equally from 2020 to 2040.

⁵ For planning purposes, the City does not anticipate receiving SWP water during the period 2020-2040.

⁶ *The City anticipates initiating a recycled water program by 2020. Estimate includes new community landscaped areas with irrigation, a potential golf course, and potential agricultural irrigation. It is anticipated that approximately 2,000 afy could be developed by 2040. For planning purposes, the 2,000 afy is distributed equally from 2020 to 2040.*

⁷ *Existing demand is from 2015 data and is made up of 2,106 af from single-family residential, 868 af from multifamily residential, 493 af from commercial/institutional, 48 af from industrial, 49 af from landscape irrigation, 22 af from other, 44 af from sales to Middleroad Mutual Water Company, and 277 af from estimate losses.*

⁸ *City anticipates 2,808 afy of new potential residential, commercial institutional, industrial, and landscape development by 2040 for build-out of potential projects.*

⁹ *Estimated at 5 percent of total new demands. ~~Projected data~~*

Notes:

All values rounded to the nearest 1 AF.

Santa Paula West Area Business Park Specific Plan would start construction in 2017 and be completed by 2027. Conservatively assumed full build-out Project Demand numbers in 2017.

The City's current (2011) allocation is 5,483 AFY.

The City currently wheels the 500 AFY of surface water from Santa Paula Creek to farmers Irrigation Company, which uses the surface water in lieu of pumped groundwater, and the City gains 500 AFY groundwater pumping credits in the Santa Paula Basin.

Total of 1,815 AFY allocation transfers achieved over 4 equal 5-year periods (approximately 454 AFY per 5-year period).

The City anticipates purchasing groundwater allocations. It is anticipated that approximately 200 AFY could be developed by 2015, 300 AFY by 2020, 400 AFY by 2025, and 497 by 2030.

The City has rights to 2,198 AFY. However, actual delivery may be only 60 percent of water rights (DWR, 2010) in an average year, 7 percent in a single dry year, and 34 percent in multiple dry years. For the purposes of this UWMP, the City does not anticipate receiving SWP water in the near future.

The City purchased the WRF in 2015, however, currently there is no infrastructure to supply recycled water to the City. The 2010 UWMP anticipated that approximately 400 afy could be developed by 2015, 800 afy by 2020, 1,200 afy by 2025, and 1,622 afy by 2030.

The 2016 UWMP Update anticipates that the City will acquire through allocation transfers 448 afy by 2020, 895 afy by 2025, 1,343 afy by 2030, 1,790 by 2035, and 2,235 afy by 2040.¹⁵

The 2010 UWMP Update anticipates that the City will acquire through allocation transfers 454 AFY by 2015, 908 AFY by 2020, 1,362 AFY by 2025, and 1,815 AFY by 2030 and 2035 through allocation transfers within the Santa Paula Basin as provided for in the Judgment.

Implementation of these water supply programs is anticipated to provide the City with sufficient water supplies to meet future water demand. As shown in **Table 4.14-67, Existing and Potential City Water Resources and Demands**, the potential water supplies available to the City exceed the estimated water demand at City build-out conditions.

Table 4.14-7

State Water Project Water

The County of Ventura contracted for 20,000 afy of State Water Project (SWP) water, with 5,000 afy of that amount subcontracted to the UWCD, which has designated 2,198 afy of SWP water for use by the

¹⁵ City of Santa Paula, Final 2016 UWMP Update (August 2017), Table 6-9.

City.¹⁶ The City has discussed a contract with UWCD to ensure that 2,198 afy is reserved for the City. The City does not anticipate directly receiving SWP water in the near future.¹⁷ However, the City may trade, transfer, and/or sell a portion of the SWP water rights to augment existing supplies.

Since the 2016~~0~~ UWMP was prepared, the California Department of Water Resources has updated its State Water Project Delivery Reliability Report three times (2011, 2013, and 2015). The biennial Report assists SWP contractors in assessing the reliability of the SWP component of their overall supplies. The 2015 SWP Reliability Report updates the DWR estimate of future water delivery reliability through 2035. The City's 2016~~0~~ UWMP update incorporates this updated information from DWR. The updated analysis in the 2015 SWP Reliability Report showed that the primary component of the annual SWP deliveries (referred to as Table A deliveries) would be less under current and future conditions.¹⁸

The 2015 SWP Reliability Report recognized continuing challenges to the ability of the SWP to deliver full contractual allotments of SWP water. For current conditions, the dominant factor for these reductions is the restrictive operational requirements contained in the federal biological opinions. Deliveries estimated for the 2015 Report expressly account for the operational restrictions of the biological opinions issued by the U.S. Fish and Wildlife Service in December 2008 and the National Marine Fisheries Service in June 2009 governing the SWP and Central Valley Project (CVP) operations. SWP exports have decreased since 2005, although the bulk of the change occurred by 2009 as the federal BOs went into effect, restricting operations. These effects are also reflected in the SWP delivery estimates. The most salient findings in this report are as follows:

- Under existing conditions, the average annual delivery of Table A water estimated for this 2015 Report is 2,550 thousand acre-feet per year (tafy), 3 tafy less than the 2,553 tafy estimated for the 2013 Report.
- The likelihood of existing-condition SWP Article 21 deliveries (supplemental deliveries to Table A water) being greater than 20 tafy has decreased by 3 percent relative to the likelihood presented in the 2013 Report.

For future conditions, the 2015 SWP Reliability Report conservatively assumed that the restrictions imposed by the biological opinions will still be in place, and includes the potential effects of climate change to estimate future deliveries. The changes in run-off patterns and amounts were included along with a potential rise in sea level. Sea level rise has the potential to require more water to be released to repel salinity from entering the San Francisco Bay/Sacramento-San Joaquin Delta Estuary ("Bay-Delta") to meet

16 City of Santa Paula, Final 2016~~2010~~-UWMP Update (June 2011/August 2017), 4213.

17 City of Santa Paula, Final 2016 UWMP Update (August 2017), 13. ~~City of Santa Paula, Final 2010 UWMP Update (June 2011), 44.~~

18 Department of Water Resources (DWR), *The State Water Project Final Delivery Capability Report 2015* (July 1, 2015), <https://msb.water.ca.gov/documents/86800/144575dd-0be1-4d2d-aeff-8d7a2a7b21e4>.

the water quality objectives established for the Delta. For the 2015 SWP Reliability Report, the changes in run-off patterns and amounts were incorporated into the analyses, but the potential rise in sea level was not.

The analyses in the 2015 SWP Reliability Report indicated that the SWP, using existing facilities operated under then current regulatory and operational constraints and future anticipated conditions, and with all contractors requesting delivery of their full Table A amounts in most years, could deliver 60 percent of Table A amounts on a long-term average basis.

Many of the same specific challenges to SWP operations described in the State Water Project Delivery Reliability Report 2013 remained in 2015—most notably, the effects on SWP pumping caused by issuance of the 2008 and 2009 federal biological opinions (BOs), which were reflected in the SWP delivery reliability report. The analyses in this report consider climate change and the effects of sea level rise on water quality, but do not incorporate the probability of catastrophic levee failure.

Recycled Water

Construction of the new City Water Recycling Facility (WRF) that meets California Title 22 regulations for recycled water was completed in early 2010.¹⁹ The WRF has a capacity of 3.15 million gallons per day (mgd), with a final build-out capacity of 4.2 mgd and a peak operating capacity of 7.0 mgd.

The 2016~~9~~ UWMP estimates recycled water urban demand within the City (and adjacent areas) will be approximately 1,622,000 afy. The 2010~~6~~ UWMP anticipates that the City will develop a recycled water program for landscape irrigation and that the estimate amounts that could be delivered in the future are 4800 afy by 2020, 1,200~~800~~ afy by 2025, ~~and 1,622-200~~ afy by 2030, 1,600 afy by 2035, 2,000 afy by 2040.²⁰ The recycled water demand could be fully met with recycled water from the new WRF.

Currently, there are no recycled water systems in the proposed Project vicinity. However, the 2012 Wastewater Master Plan has included West Area 2 to have a future wastewater flow of 0.082 mgd or 919 afy during average dry weather season.²¹

21 City of Santa Paula, *Wastewater System Master Plan* (June 2012)

Water Conveyance System

The City's domestic water supply is conveyed via gravity throughout its distribution network system. The City currently delivers a portion of the overall domestic water supplies to the Project Site. The closest existing domestic water system to the Project Site includes a main line within Telegraph Road.

Wastewater

The City of Santa Paula Public Works Water Division provides wastewater services to the City.

On-site Sewer

The Project Site is not connected to the City's wastewater treatment system. There are two small farmworker dwelling units and ancillary agricultural facilities located on-site. These residences and the ancillary facilities utilize septic systems to store wastewater, which is periodically pumped and disposed of via private sewage collection services. The nearest sewer system pipeline is an 8-inch line located beneath Telegraph Road to the north of the Project Site.

Citywide Sewer System

The City's Wastewater System Master Plan, prepared by Boyle Engineering and updated by the City of Santa Paula in June 2012, addresses the provisions of wastewater collection facilities to serve the West Area 2 Expansion Area. In May 2015, Jensen Design & Survey, Inc. prepared the Sanitary Sewer Technical Report to provide a blueprint for the design of the sanitary system within the Specific Plan area and to develop conceptual design parameters. The wastewater system consists of approximately 60 miles of collection lines, with pipeline diameters ranging from 6 to 24 inches, 0.5 miles of force mains, 1,190 manholes, and two lift stations. Wastewater flows are conveyed by gravity through the existing pipe network. Two City-owned and -operated sewer lift stations (Harding Park and Lemonwood pump stations) are also used to convey these flows in areas where gravity flow is inadequate. These flows are eventually treated at the existing wastewater treatment plant (WTP) located in the southwest corner of the City.

In January 2012, the City adopted the 2011 Sanitary Sewer Management Program, which provides long-term maintenance for the system to preserve and provide adequate collection and transportation of local wastewater.

Treatment Plant Capacity

The City residents generate and treat approximately 2 mgd of sewage. The City has defined geographic boundaries in which residential, commercial, public, and industrial areas are defined. Each group generates wastewater, which enters the sewer system and is ultimately treated at the WTP. The City constructed a water recycling facility (WRF) for the treatment of sewage generated by the City to replace

the original WTP. The new WRF began operations in May of 2010. This new facility has a normal operating capacity of 3.15 mgd with a final build-out capacity of 4.2 mgd, and a peak operating capacity of 7.0 mgd. The process design is a membrane bioreactor (MBR) and reduces energy costs by more than 35 percent. The facility, which has a footprint of 1.5 acres, is completely enclosed for maximum odor and noise control.

The WRF will be capable of producing California Code of Regulations (CCR) Title 22 unrestricted water reuse for agricultural and municipal needs. The treated effluent produced meets the Los Angeles Regional Water Quality Control Board's (RWQCB's) current wastewater discharge requirements, as well as California Department of Health Service (DHS) requirements for recycled water use. Prior discharges to the Santa Clara River received advanced secondary treatment.

Solid Waste

Solid waste collection services are provided in the City of Santa Paula by a private solid waste collection company and disposed of at the Toland Road Landfill, operated by the Ventura Regional Sanitation District (VRSD).

The City participates in a curbside recycling program, which includes the recycling of glass (food and beverage containers), metal (aluminum cans, etc.), and plastic. Curbside pickup of paper, cardboard, and yard trimmings is provided, as well as community drop-off events for residents to dispose of large items, household hazardous waste, and motor oil and filters.

In 2015, the City disposed of 25,684 tons of solid waste at all landfills identified below except for the Bakersfield Metropolitan (Bena) Sanitary Landfill.²² The City provides refuse collection, recycling, and disposal through contracts with Crown Disposal Co., Inc., a private hauling company. Crown Disposal collects 100 percent of the City's solid waste. The solid waste is disposed of at Toland Road Sanitary Landfill; Chiquita Canyon Sanitary Landfill; Simi Landfill and Recycling Center; Azusa Land Reclamation Co. Landfill; Antelope Valley Public Landfills I and II; and the Bakersfield Metropolitan (Bena) Sanitary Landfill. **Table 4.14-8, Solid Waste Facilities**, provides the characteristics of the disposal waste facilities that currently accept waste from the City.

22 California Department of Resources Recycling and Recovery (CalRecycle), Disposal Reporting System (DRS), Jurisdiction Disposal by Facility during 2015 for Santa Paula.

**Table 4.14-8
Solid Waste Facilities**

Facility	Daily Capacity (tons/day)	Remaining Capacity (cy)	Ceased Operation Date
Toland Road Sanitary Landfill	1,500	21,983,000 ^a	2027
Chiquita Canyon Sanitary Landfill	6,000	8,617,126 ^b	2019
Simi Valley Landfill & Recycling Center	9,250	119,600,000 ^c	2052

The existing uses within the Project Site include two small farmworker dwelling units and agricultural operations for the production of orchards, row crops, and a limited number of livestock. Therefore, the Project Site currently generates approximately 4.08 tons of solid waste per year.²³ The existing amount of agricultural crop residual is considered negligible because it is a subcomponent of the “other organic” standard material type developed by CalRecycle (formerly the California Integrated Waste Management Board).²⁴

4.14.2 REGULATORY SETTING

Water

Federal

Safe Drinking Water Act

The Safe Drinking Water Act (SDWA) was originally passed by Congress in 1974 to protect public health by regulating the nation's public drinking water supply. The law was amended in 1986 and 1996 and requires a variety of actions to protect drinking water and its sources. SDWA authorizes the U.S.

23 Solid Waste generation is 2.04 tons per year per residential unit. Source: Ventura County Solid Waste Management Department, Estimated Solid Waste Generation Rates for Industrial/Commercial/Residential Establishments, Guidelines for Preparation of Environmental Assessments for Solid Waste Impacts.

24 CalRecycle (formerly the California Integrated Waste Management Board), *California 2008 Waste Characterization Study* (August 2009), 107.

Environmental Protection Agency (USEPA) to set national health-based standards for drinking water to protect against both naturally occurring and man-made contaminants that may be found in drinking water. The USEPA, state agencies, and water purveyors work together to ensure that SDWA standards are met.

State

California Department of Water Resources

The State of California Department of Water Resources (DWR) released its *State Water Project Final Delivery Capability Report* (“Report”) in July 2015. The Report updates the estimated water delivery capacity of the SWP for current conditions and two decades from 2015.²⁵ The estimates include the best-known future effects of climate change and the anticipated changes in Sacramento River basin land uses. The assessment of current and future SWP reliability allows DWR to plan for reliable future water supplies in California.

Comprehensive Water Legislation

In November 2009, four legislative bills (SBX7-1, SBX7-6, SBX7-7, and SBX7-8) and the supporting bond bill (SBX7-2), creating a comprehensive water package designed to meet California’s water challenges, were approved by then-governor Arnold Schwarzenegger.²⁶ The legislation establishes the governmental framework to achieve the coequal goals of providing a more reliable water supply to California and restoring and enhancing the Delta ecosystem. The package includes requirements to improve the management of California’s water resources by monitoring groundwater basins; developing agricultural water management plans; reducing statewide per capita water consumption 20 percent by 2020; and reporting water diversions and uses in the Delta. It also appropriates \$250 million for grants and expenditures for projects to reduce dependence on the Delta if the bond issue is approved by the voters in the future.

The Safe, Clean, and Reliable Drinking Water Supply Act of 2010 (SBX 7-2) was placed and passed on the November 2014 ballot as California Proposition 1, the Water Bond (AB 1471). AB 1471 provides funding for California’s aging water infrastructure, as well as for projects and programs to improve the ecosystem and water supply reliability for California. The bond bill includes \$2.7 billion for actions improving Bay-Delta sustainability. These investments will help to reduce seismic risk to

25 Department of Water Resources (DWR), *The State Water Project Final Delivery Capability Report 2015* (July 1, 2015), <https://msb.water.ca.gov/documents/86800/144575dd-0be1-4d2d-aeff-8d7a2a7b21e4>.

26 Department of Water Resources (DWR), *California Water Plan Update 2009*, vol. 4 (December 2009). Reference Guide, Legislation, 2009 Comprehensive Water Package, Special Session Policy Bills and Bond Summary, (November 2009).

Bay-Delta water supplies, protect drinking water quality, and reduce conflict between water management and environmental protection.

Part of the comprehensive water package included SBX7-7 (Steinberg, Chapter 4, Statutes of 2009—Statewide Water Conservation). This bill creates a framework for future planning and actions by urban and agricultural water suppliers to reduce California’s water use. SBX7-7 requires the development of agricultural water management plans and requires urban water agencies to reduce statewide per capita water consumption 20 percent by 2020. CVWD has included the provisions of SBX7-7 in its 2010 UWMP and has reduced water demand by 20 percent since 2006.

On January 17, 2014, California Governor Brown declared a drought state of emergency, and directed state officials to take all necessary actions to prepare for these drought conditions.²⁷ State agencies, led by the Department of Water Resources, are in the process of executing a statewide water conservation campaign, calling on Californians to reduce their water usage by 20 percent.

Recent Regulations, Executive Orders and SWRCB Actions

Executive Orders

On January 17, 2014, Governor Edmund G. Brown Jr. declared a drought state of emergency.²⁸ On April 25, 2014, the governor signed Executive Order B-26-14²⁹ (April 2014 Proclamation) stating, among other things, that

severe drought conditions continue to present urgent challenges: water shortages in communities across the state, greatly increased wildfire activity, diminished water for agricultural production, degraded habitat for many fish and wildlife species, threat of saltwater contamination of large fresh water supplies conveyed through the Sacramento-San Joaquin Bay Delta, and additional water scarcity if drought conditions continue into 2015.

On December 22, 2014, Governor Brown issued Executive Order B-28-14,³⁰ which extended the suspension of certain activities subject to CEQA contained in the January 2014 and April 2014 Proclamations, including the SWRCB adoption of emergency regulations pursuant to Water Code section 1058.5, through May 31, 2016. On March 17, 2015, the SWRCB adopted an expanded emergency

28 Office of the Governor, “Governor Brown Declares Drought State of Emergency,” January 17, 2014, <http://gov.ca.gov/news.php?id=18368>.

29 State of California, Executive Order for State Drought Actions, B-26-14, April 25, 2014, <http://gov.ca.gov/news.php?id=18496>.

30 State of California, Office of Governor Edmund G. Brown Jr., “Executive Order B-28-14” (December 22, 2014), <https://www.gov.ca.gov/news.php?id=18815>.

conservation regulation prohibiting certain irrigation practices, restricting certain commercial activities, and ordering all urban water suppliers to implement mandatory restrictions on outdoor irrigation. The emergency regulation orders larger urban water suppliers—those providing water for municipal purposes to more than 3,000 customers or supplying more than 3,000 acre-feet of water annually, excluding wholesalers—to provide monthly data on water production, enforcement, and outdoor water conservation measures being implemented.

On April 1, 2015, Governor Brown signed Executive Order B-29-15,³¹ directing the SWRCB to impose restrictions to achieve a statewide 25 percent reduction in potable urban water usage, compared to the amount used in 2013, through February 2016. The governor instructed the SWRCB to consider the relative per capita water usage of each supplier's service area and to require those areas with high per capita use to achieve proportionally greater reductions than those with low use. The order mandates that the governor's January 17, 2014, Proclamation, April 25, 2014, Proclamation, Executive Order B-26-14, and Executive Order B-28-14 remain in full force and effect except as modified.

State Water Resources Control Board

In 2014, the State Water Resources Control Board (SWRCB) determined that an emergency existed due to severe drought conditions and that adoption of the proposed emergency regulation was necessary to address the emergency. California is currently in the fourth year of a significant drought resulting in severe impacts to California's water supplies and its ability to meet all the demands for water in the State.

On May 5, 2015, the SWRCB adopted an emergency conservation regulation in accordance with the governor's directive. The provisions of the emergency regulation went into effect on May 18, 2015.³² The emergency regulation identifies how much water communities must conserve based on their average residential water use, per person per day, last summer. Every person should be able keep indoor water use to no more than 55 gallons per day. For the most part, the amount of water that each person uses in excess of this amount is water that is applied to lawns and other ornamental landscapes.

31 State of California, Executive Department, Executive Order B-29-15 (April 1, 2015), http://gov.ca.gov/docs/4.1.15_Executive_Order.pdf

32 State Water Resources Control Board, Resolution No. 2015-2032, Emergency Regulation for Statewide Urban Water Conservation (adopted May 5, 2015).

To reduce water use by 25 percent statewide, a regulation adopted by the SWRCB places each urban water supplier into one of eight tiers which are assigned a conservation standard, ranging between four percent and 36 percent.³³

As of March 2016, the City of Santa Paula had a Conservation Standard of 26 percent as directed by the SWRCB and from March 2016 to June 2016, they had achieved 24.2 percent water savings. The Governor issued new Executive Order, as of June 1, 2016, reducing the Conservation Standards as a result of improved conditions and the City now has a zero percent conservation standard.³⁴

Legislative Actions

Sustainable Groundwater Management Act

In September 2014, Governor Edmund G. Brown Jr. signed a three-bill package known as the Sustainable Groundwater Management Act (SGMA). The legislation allows local agencies to customize groundwater sustainability plans to their regional economic and environmental needs. SGMA creates a framework for sustainable, local groundwater management for the first time in California history. SGMA empowers local agencies to adopt groundwater management plans that are tailored to the resources and needs of their communities.

The three bills that make up SGMA are AB 1739 (Dickinson), SB 1168 (Pavley), and SB 1319 (Pavley).

AB 1739—Groundwater Management

AB 1739 (Dickinson) authorizes the DWR or a groundwater sustainability agency (GSA) to provide technical assistance to entities that extract or use groundwater to promote water conservation and protect groundwater resources. This bill requires the DWR, by January 1, 2017, to publish on its Internet website best management practices for the sustainable management of groundwater, and requires the DWR to prepare and release a report by December 31, 2016, on the agency's best estimate of water available for replenishment of groundwater in the state.

AB 1739 –requires a GSA to submit a groundwater sustainability plan (GSP) to DWR for review upon adoption. The bill authorizes a local agency to submit to DWR for evaluation and assessment an alternative

33 State of California, Office of Administrative Law, OAL File No. 2015-0506-02 EE, Notice of Approval of Emergency Regulatory Action, State Water Resources Control Board (May 18, 2015).

http://www.waterboards.ca.gov/waterrights/water_issues/programs/drought/docs/emergency_regulations/oal_approved_regs2015.pdf.

34 State Water Resources Control Board, Self-Certification Conservation Standards—"Stress-test" (by supplier), http://www.waterboards.ca.gov/water_issues/programs/conservation_portal/docs/emergency_reg/uw_self-cert_summary.pdf. Accessed October 18, 2016.

that the local agency believes satisfies the objectives of these provisions. AB 1739 also requires DWR to review any of the above-described submissions at least every 5 years after initial submission to DWR.

In addition, AB 1739 -requires that prior to the adoption or any substantial amendment of a general plan, the planning agency review and consider a GSP; groundwater management plan; groundwater management court order, judgment, or decree; adjudication of water rights; or a certain order or interim plan by the SWRCB. AB 1739 requires the planning agency to refer a proposed action to adopt or substantially amend a general plan to any GSA that has adopted a GSP or local agency that otherwise manages groundwater, and to the SWRCB if it has adopted an interim plan that includes territory within the planning area.

SB 1168—Groundwater Management

SB 1168 (Pavley) notes that the policy of the state is that groundwater resources be managed sustainably for long-term reliability and multiple economic, social, and environmental benefits for current and future beneficial uses. This bill states that sustainable groundwater management is best achieved locally through the development, implementation, and updating of plans and programs based on the best available science.

SB 1168 requires DWR to categorize each basin as high, medium, low, or very low priority. The initial priority for each basin was to be established no later than January 31, 2015. The bill authorizes a local agency to request that DWR revise the boundaries of a basin and required DWR to adopt by January 1, 2016, regulations on the methodology and criteria to be used to evaluate the proposed revision.

In addition, all groundwater basins designated as high- or medium-priority basins by the DWR that are designated as basins subject to critical conditions of overdraft are to be managed under a GSP or coordinated GSPs by January 31, 2020; all other groundwater basins designated as high- or medium-priority basins are to be managed under a GSP or coordinated GSPs by January 31, 2022.

This bill would authorize any local agency, as defined, or combination of local agencies to elect to be a GSA and would require, within 30 days of electing to be or forming a GSA, said agency to inform the DWR of its election or formation and its intent to undertake sustainable groundwater management.

SB 1319—Groundwater

SB 1319 (Pavley) prohibits the SWRCB from establishing an interim plan to remedy a condition where the groundwater extractions result in significant depletions of interconnected surface waters until January 1,

2025. This provision delays the similar provision in AB 1739 from 2022 to 2025. The bill further requires the SWRCB to exclude any portion of a basin in compliance with groundwater management requirements from probationary status. This provision narrows the similar provision in AB 1739 to only apply to the portion of the basin that is out of compliance.

The bill requires the SWRCB to include any element of a GSP or the entire plan in its interim plan if SWRCB finds it would help meet the sustainability goal. This provision revises the similar provision in AB 1739 to allow for the inclusion of local plans when developing interim plans for basins with probationary status.

A GSP has not yet been adopted for the Santa Paula Basin pursuant to SGMA and is not required until 2022.

SB 1262 (Pavley)—Water Supply Planning

In September 2016, Governor Brown signed SB 1262 (Pavley), which states that if a water supply for a proposed project includes groundwater from a basin that is not adjudicated and is designated as medium or high priority, the following additional information must be included in the WSA: whether DWR has identified the basin as being subject to critical conditions of overdraft; and if a GSA has adopted a (GSP) or approved an alternative plan under the SGMA, a copy of the GSP, or an alternative plan. For a basin that is not adjudicated and is designated by DWR as low or very low priority, the WSA must include information as to whether DWR has identified the basin as being overdrafted or projected that the basin will become overdrafted if present management conditions continue.

SB 1262 is not effective until January 1, 2017. However, as noted earlier, pursuant to SB 1262 and the amended Water Code Section 10910, the Santa Paula Basin is an adjudicated Basin of which the DWR has not indicated is in overdraft.³⁵

Water Supply Availability and Reliability

The City is required under California Water Code (Sections 10610 to 10656) to assess citywide water supply and demand over the next 20 years in 5-year increments in its UWMP. The City completed its most recent update in 2016~~0~~. The 2016~~0~~ update examines water planning, including recycled water, over a 20-year period in 5-year increments; identifies and quantifies adequate water supplies for existing and future water demands in normal, dry, and multiple dry years; identifies actions to prepare for and implement during a catastrophic interruption of water supplies; and implements conservation and efficient use of

35 California's Groundwater Bulletin 118, Santa Clara River Valley Basin Santa Paula Subbasin, http://www.water.ca.gov/pubs/groundwater/bulletin_118/basindescriptions/4-4.04.pdf.

urban water supplies. The UWMP determined that the City's current water supplies are sufficient to meet proposed General Plan development levels to 2020.

Water Supply Assessment Study

The California Water Code, Section 10912 requires that a detailed report regarding water availability and planning for additional water supplies be included for the following types of projects:

- A proposed residential development of more than 500 dwelling units
- A proposed shopping center or business establishment employing more than 1,000 persons or having more than 500,000 square feet of floor space
- A proposed commercial office building employing more than 1,000 persons or having more than 250,000 square feet of floor space
- A proposed hotel or motel, or both, having more than 500 rooms
- A proposed industrial, manufacturing, or processing plant, or industrial park planned to house more than 1,000 persons, occupying more than 40 acres of land, or having more than 650,000 square feet of floor area
- A mixed-use project that includes one or more of the projects specified in this subdivision
- A project that would demand an amount of water equivalent to, or greater than, the amount of water required by a 500-dwelling unit project

In addition, Government Code Section 66473.7 requires that adequate water supplies be demonstrated as available for the following:

- A proposed residential development of more than 500 dwelling units, if the public water system (PWS) has more than 5,000 service connections
- Any proposed development that increases connections by 10 percent or more, if the PWS has fewer than 5,000 connections

California Green Building Standards Code

The purpose of the California Green Building Standards Code ("CALGreen") is to improve public health, safety, and general welfare by enhancing the design and construction of buildings through the use of building concepts having a reduced negative impact or positive environmental impact and encouraging sustainable construction practices in the following categories:

1. Planning and design
2. Energy efficiency
3. Water efficiency and conservation
4. Material conservation and resource efficiency
5. Environmental quality

The residential mandatory measures are provided in chapter 4 and the nonresidential ones in chapter 5 of the CALGreen Code.

In response to State of Emergency proclamations issued by Governor Brown in January and April of 2014, and most recently Executive Order B-29-15 (issued April 1, 2015), California Department of Housing and Community Development (HCD) proposed emergency building standard regulations pertaining to the reduction of potable water use for exterior landscape irrigation for newly constructed residential buildings. HCD, in coordination with the California Building Standards Commission (CBSC), Department of Water Resources (DWR), the Division of the State Architect, and other stakeholders, developed emergency regulations that amend the 2016 CALGreen Code.³⁶

CALGreen provides mandatory residential measures, such as stormwater drainage and retention systems, which are thought to prevent flooding of adjacent properties and prevent pollution from stormwater runoff by retaining soil on site or by providing filtering to restrict sedimentation from reaching stormwater drainage systems and receiving streams or rivers. To comply, the retention basin must be sized and shown on the site plan, and water has to be filtered and routed to a public drainage system. The new residential structure also must comply with local stormwater ordinances. The drainage system must also be shown on the site plan (swales, drain piping, retention areas, and groundwater recharge).

The code also requires a 20 percent reduction of indoor water use, and it utilizes both a prescriptive and performance method. The prescriptive method provides some technical features that must be followed:

- Showerheads \leq 2.0 gallons per minute (gpm) at 80 pounds per square inch (psi)
- Lavatory faucets \leq 0.5 gpm at 60 psi
- Kitchen faucets \leq 1.8 gpm at 60 psi
- Urinals \leq 0.5 gal/flush
- Water closets \leq 1.28 gallon/flush

36 California Department of Housing and Community Development, Finding of Emergency Regarding the 2013 California Green Building Standards Code (CALGreen), California Code of Regulations, tit. 24, pt. 11.

CALGreen also specifies acceptable performance standards for plumbing fixtures with reduced water usage. Fixtures can be installed if they meet standards listed in the code.

Outdoor water usage is regulated. CALGreen requires irrigation controls to be weather or soil moisture based and to automatically adjust irrigation in response to changes in plants' needs as weather conditions change, or have rain sensors or communication systems that account for local rainfall.

Local

2016~~0~~ Urban Water Management Plan Update

Section 10610 et seq. of the California Water Code, known as the Urban Water Management Planning Act, calls for creation and periodic update of UWMPs by all urban water suppliers and sets forth the requirements for such plans, including definition of relevant terms.

Under the definition given in Section 10617, an urban water supplier is an entity “providing water for municipal purposes either directly or indirectly to more than 3,000 customers or supplying more than 3,000 acre-feet of water annually.” Water for this development will be supplied from the City of Santa Paula’s existing water system, which is supplied via groundwater wells throughout the City.

In 2017~~4~~, the City of Santa Paula completed an UWMP update that included the portions of the East Area 2 Annexation Area located east of the City, south of the Ventura County Transportation Commission railroad, surrounds Hallock Drive area, but excluded the triangle area north of Hallock Drive.³⁷ This UWMP did not discuss the specific development and activities contemplated by the Santa Paula West Business Park, although it did discuss, in general terms, the nature and extent of the long-term water supply for the City for the West Area 2 and included an estimated 1,906,000 square feet of commercial/industrial/institutional uses on approximately 125 acres. Much of this general discussion is cited and paraphrased in this WSA. The UWMP contains an analysis of the factors required by Government Code section 66437.7 (a)(2), and such factors apply to this WSA.

Accordingly, ~~this WSA~~ the attached WSA, in concert with the UWMP prepared by the City, includes all necessary data and analyses required by California Water Code section 10910 et seq. and by Government Code section 66437.7 et seq.

~~The 2010 UWMP is currently being updated to meet the DWR’s requirements for the 5-year update for 2015; a revised update is anticipated in early 2017.~~

37 City of Santa Paula, *General Plan*, “Land Use Element” (2011), LU-24.

Water In-Lieu Fee Ordinance

In accordance with City of Santa Paula Municipal Code (SPMC) Section 52.021 (Water Resource In-Lieu Fee Ordinance No. 1058), landowners or developers are required to transfer their groundwater rights to the City as a condition of project approval. The intent of the Ordinance is to ensure that new urban land users provide sufficient water resources for their needs without taxing existing users. If the associated water rights are not sufficient to serve the proposed development's anticipated water use (as determined by the City), or if the water rights are held by another entity who cannot or will not dedicate those rights to the City, the developer must purchase additional water rights and dedicate them to the City or pay a water resource in-lieu fee to the City. This ordinance applies to water rights within City limits as well as parcels outside City limits who must receive service from the City Water Enterprise.

City Municipal Code—Ordinance Section 52.038, Water Waste

"No person shall [un]lawfully or neglectfully waste water in any manner whatsoever. Continued wasting of water after mailing of [City] notice by registered mail to the customer of record at the mailing address of record by the [City] Director may result in discontinued water service." This Code is a beneficial tool to curb misuse and waste of potable water within the City. The provisions of the Code can be used during periods of normal water supply and supply deficiency. Violation of this Code is subject to City penalties.

City Municipal Code—Ordinance 1223, Chapter 59, Landscape Water Conservation Standards

In accordance with Government Code 65565(c) for the purpose of complying with California law and promoting water conservation, the City maintains Ordinance 1223, Landscape Water Conservation Standards, to be utilized in conjunction with the City of Santa Paula Land Development Provisions for Landscaping and the Guidelines for Implementation of Water Efficient Landscape. Compliance with the guidelines and Landscape Water Conservation Standards is mandatory for all new development projects that are subject to discretionary review by the City of Santa Paula.

Wastewater

Federal

Clean Water Act

As noted elsewhere, the federal Clean Water Act (CWA) Section 401 regulates the discharges of pollutants into Waters of the United States from any point or nonpoint source. Individual permits are issued for certain defined sources of discharge, while nonpoint source runoff from construction sites and urban development is regulated under a series of general permits. Construction that disturbs 1 acre or more is regulated under the National Pollutant Discharge Elimination System (NPDES) stormwater program. In the State of California, the program is administered by the local RWQCB.

Federal Pretreatment Regulations

Part 403 in the Code of Federal Regulations establishes the responsibilities of federal, state, and local government, industry and the public with respect to implementing National Pretreatment Standards to control pollutants that pass through or interfere with treatment processes in publicly owned treatment works (POTW) or that may contaminate sewage sludge.

Title 22 Recycled Water

Title 22 sets bacteriological water quality standards based on the expected degree of public contact with recycled water.³⁸ Title 22 establishes the quality and/or treatment processes required for an effluent to be used for a specific nonpotable application. The following categories of recycled water are identified:

- Disinfected tertiary recycled water
- Disinfected secondary-2.2 recycled water
- Disinfected secondary-23 recycled water
- Un-disinfected secondary recycled water

In addition to recycled water uses and treatment requirements, Title 22 addresses sampling and analysis requirements at the treatment plant, preparation of an engineering report prior to production or use of recycled water, general treatment design requirements, reliability requirements, and alternative methods of treatment.

State

The California Ocean Plan was originally adopted by the SWRCB and approved by the USEPA in June 1972, and is revised every three years. Among the California Ocean Plan requirements are the following water quality objectives (Chapter II):

General Provisions

- a. *This chapter sets forth limits or levels of water quality characteristics for ocean waters to ensure the reasonable protection of beneficial uses and the prevention of nuisance. The discharge of waste shall not cause violation of these objectives.*
- b. *The Water Quality Objectives and Effluent Limitations are defined by a statistical distribution when appropriate. This method recognizes the normally occurring variations*

38 20 CCR, sec. 1605.1 Federal and State Standards for Federally Regulated Appliances, and 1605.3, State Standards for Non-Federally Regulated Appliances.

in treatment efficiency and sampling and analytical techniques and does not condone poor operating practices.

c. *Physical Characteristics*

1. *Floating particulates and grease and oil shall not be visible.*
2. *The discharge of waste shall not cause aesthetically undesirable discoloration of the ocean surface.*
3. *Natural light shall not be significantly reduced at any point outside the initial dilution zone as the result of the discharge of waste.*
4. *The rate of deposition of inert solids and the characteristics of inert solids in ocean sediments shall not be changed such that benthic communities are degraded.*

d. *Chemical Characteristics*

1. *The dissolved oxygen concentration shall not at any time be depressed more than 10 percent from that which occurs naturally, as the result of the discharge of oxygen demanding waste materials.*
2. *The pH shall not be changed at any time more than 0.2 units from that which occurs naturally.*
3. *The dissolved sulfide concentration of waters in and near sediments shall not be significantly increased above that present under natural conditions.*
4. *The concentration of substances set forth in Chapter II, Table B, in marine sediments shall not be increased to levels which would degrade indigenous biota.*
5. *The concentration of organic materials in marine sediments shall not be increased to levels that would degrade marine life.*
6. *Nutrient materials shall not cause objectionable aquatic growths or degrade indigenous biota.*

e. *Biological Characteristics*

1. *_____ Marine communities, including vertebrate, invertebrate, and plant species, shall not be degraded.*

2. *The natural taste, odor, and color of fish, shellfish, or other marine resources used for human consumption shall not be altered.*
3. *The concentration of organic materials in fish, shellfish or other marine resources used for human consumption shall not bioaccumulate to levels that are harmful to human health.*

Local

The Los Angeles RWQCB regulates the treatment of wastewater at treatment plants and the discharge of the treated wastewater into receiving waters. The City is responsible for adhering to Los Angeles RWQCB regulations as they apply to wastewater generated and discharged by the WRF. The resulting effluent from the treatment process must meet the Waste Discharge Requirements (WDR) Order No. R4-2007-0028 as amended by WDR Order No. R4-2010-0074.

Solid Waste

Federal

Resource Conservation and Recovery Act

The Resource Conservation and Recovery Act (RCRA) is the nation's primary law governing the disposal of solid and hazardous waste. The RCRA set national goals for reducing the amount of waste generated and ensuring that wastes are managed in an environmentally sound manner. The Solid Waste Program encourages states to develop comprehensive plans to manage nonhazardous industrial solid waste and municipal solid waste, sets criteria for municipal solid waste landfills, and prohibits the open dumping of solid waste. RCRA regulations encourage source reduction and recycling, and promote the safe disposal of municipal waste.

State

Assembly Bill 939

Assembly Bill (AB) 939 (Chapter 1095, Statutes of 1989), the Integrated Waste Management Act, required, among other things, all cities and counties to divert 25 percent of all solid waste from landfill facilities by January 1, 1995, and 50 percent by January 1, 2000. In addition, AB 939 requires each county and incorporated cities to prepare a Source Reduction and Recycling Element for its jurisdiction, identifying waste characterization; source reduction; recycling; composting, solid waste facility capacity; education and public information; funding; special waste (asbestos, sewage sludge, etc.); and household hazardous waste, in addition to a countywide Siting Element specifying areas for transformation or disposal sites to provide capacity for solid waste generated in the jurisdiction that cannot be reduced or recycled for a 15-year period. Each city plan must demonstrate integration with the relevant county plan. The plans must

promote (in order of priority) source reduction, recycling and composting, and environmentally safe transformation and land disposal. Elements of the plans must be updated every 5 years.

California’s 75-Percent “Recycling” Goal

On October 6, 2011, Governor Brown signed AB 341, establishing a State policy goal that no less than 75 percent of solid waste generated be source reduced, recycled, or composted by 2020, and requiring CalRecycle to provide a report to the Legislature that recommends strategies to achieve the policy goal by January 1, 2014. The bill also mandates that local jurisdictions implement commercial recycling by July 1, 2012.

Local

Santa Paula Municipal Code Chapter 50.015

Per Santa Paula Municipal Code, responsible persons must arrange for solid waste collection service with the city or a franchisee.³⁹ Regulations regarding the use of containers stipulate the following:

- Responsible persons must keep in a suitable place one or more containers capable of holding, without spilling, leaking, or emitting odors, all solid waste that accumulates on the premises between the times of two successive collections.
- Responsible persons must deposit in containers or commercial bins provided by the city or franchisee all solid waste generated or accumulated on premises.
- It is unlawful for any person to place ashes that are not cold and free from fire in any container.

Santa Paula Municipal Code Chapter 50.140

In response to AB 393, the City adopted Santa Paula Municipal Code Section 50.140, which requires permit applicants working on construction, remodeling, and/or demolition projects within City limits to practice waste prevention; to reuse, recycle or salvage; and, least preferred, to deposit waste in landfills.

- Waste generators must complete a Certificate of Implementation and a Waste Reduction & Recycling Summary Report (WRRS). The thresholds for planning and reporting job site waste diversion are:
 - Commercial and residential additions or alterations that require a building permit and are greater than 500 square feet
 - Demolition of any structure requiring a permit, regardless of cost or value
 - All new construction (pursuant to the Green Building Code)

³⁹ Santa Paula Municipal Code, tit. V, Public Works, ch. 50.015.

4.14.3 THRESHOLDS OF SIGNIFICANCE

To assist in determining whether a project would have a significant effect on the environment, the CEQA identifies criteria for conditions that may be deemed to constitute a substantial or potentially substantial adverse change in physical conditions. Specifically, Appendix G of the State CEQA Guidelines (Environmental Checklist Form) lists the following thresholds, under which a project may be deemed to have a significant impact on utilities and service systems if it would:

- Exceed wastewater treatment requirements of the applicable Regional Water Quality Control Board?
- Require or result in the construction of new water or wastewater treatment facilities or expansion of existing facilities, the construction of which could cause significant environmental effects?
- Require or result in the construction of new storm water drainage facilities or expansion of existing facilities, the construction of which could cause significant environmental effects?
- Have sufficient water supplies available to serve the project from existing entitlements and resources, or are new or expanded entitlements needed?
- Result in a determination by the wastewater treatment provider which serves or may serve the project that it has adequate capacity to serve the project's projected demand in addition to the provider's existing commitments?
- Be served by a landfill with sufficient permitted capacity to accommodate the project's solid waste disposal needs?
- Comply with federal, state, and local statutes and regulations related to solid waste?

4.14.4 PROJECT IMPACTS

Threshold: **Exceed wastewater treatment requirements of the applicable Regional Water Quality Control Board?**

The City's Public Works Department oversees management of all water and wastewater issues for the City. The City recently constructed a new WRF in 2010 that treats the wastewater generated within City limits. The City is located within the jurisdiction of the Los Angeles RWQCB.

The Los Angeles RWQCB regulates the treatment of wastewater at treatment plants and the discharge of the treated wastewater into receiving waters. The City is responsible for adhering to Los Angeles RWQCB regulations as they apply to wastewater generated and discharged by the WRF. The resulting effluent from the treatment process must meet WDR Order No. R4-2007-0028 as amended by WDR Order No. R4-2010-0074. Development of the Project will result in the removal of the existing septic tanks that currently serve the site. Once developed and occupied, uses within the Specific Plan area will generate wastewater that will be connected to the City's sewer system and conveyed through a series of pipelines to the WRF

for treatment. Effluent from the treatment plant must comply with the SPMC to meet the requirements of the WDR permit issued to the City by the Los Angeles RWQCB.

As a result, the treated effluent will not exceed applicable requirements, and the Project's potential impacts related to wastewater treatment are less than significant.

Threshold: Require or result in the construction of new water or wastewater treatment facilities or expansion of existing facilities, the construction of which could cause significant environmental effects?

Water and Recycled Water System

The Specific Plan's domestic water system would receive water via proposed 10- and 12-inch water mains as identified in **Figure 2.0-11, Domestic and Recycled Water Master Plan**. The point of connections (POCs) for the Project would be along Faulkner Road and Telegraph Road. The existing 8-inch water line located beneath Beckwith Road would remain in place.

From the point of connections, a new 12-inch line would proceed north through the Project Site. The proposed distribution system will be comprised of 8-inch through 12-inch mains. The water mains located beneath Beckwith Road and Faulkner Road would be publicly owned and maintained, while the remaining on-site domestic and fire would be master metered.

Construction of the City's WRF was completed early 2010. The treatment capacity of the City WRF is 4.2 mgd, or 4,704 afy. The City WRF produces water that meets California Title 22 regulations for recycled water. At present, recycled water is not available within the City of Santa Paula area. Estimated recycled water urban demand within the City (and adjacent areas) will be approximately 1,622 AFY. The recycled water demand could be fully met with recycled water from the new WRF.

The City purchased the WRF in 2015; however, the City presently does not have the funds to distribute the water. According to the City's Potable Water System Master Plan, the City would, in the future, develop a recycled water system conveyance plan that would include a line in Telegraph Road. The Project includes an on-site recycled water distribution system to irrigate the greenbelt and other irrigation areas. This will allow the Specific Plan area to make use of recycled water when the City completes its planned recycled water plan and extends a line to the point of connection in the railroad right of way at Beckwith Road.

The Specific Plan's recycled water system would operate via a proposed 12-inch distribution main constructed beneath Telegraph Road, which is currently within City limits. The proposed recycled water distribution system will be comprised of 6-inch mains from the POC of the City's recycled water system.

This terminus would become the main POC for the proposed Project, in addition to a POC located beneath the Ventura County Transportation Commission (VCTC) railroad right-of-way.

Water and recycled water pipeline construction impacts would be less than significant because they would be required to comply with the City's noise ordinance, construction traffic management plan, requirements to cease construction should cultural resources be uncovered, and restrictions to avoid underground pipelines during excavation. In addition, no new or increased severity of impacts would occur as a result of the Project.

Wastewater Collection System and Treatment

As previously described, there is no existing sewer system in the Specific Plan area. The City's Wastewater System Master Plan identifies and describes the improvements required to service the Project Site, such as a new off-site mainline that will need to be completed prior to implementation of the Specific Plan. The connection of the Project Site to the City's system would utilize a new lift station at the intersection of Beckwith Road and Faulkner Road at the southeast corner of the Specific Plan area. These improvements would bring the site's POC for sewer service to this proposed lift station and would require completion prior to implementation of Specific Plan. The Sewer System Master Plan for the Specific Plan is shown in **Figure 2.0-12, Sewer System Master Plan**.

Construction of these improvements would require temporary construction and lane closures where the sewer line is constructed within the road rights-of way. Pipeline construction impacts would be less than significant because they would be required to comply with the City's noise ordinance, construction traffic management plan, requirements to cease construction should cultural resources be uncovered, and restrictions to avoid underground pipelines during excavation.

The new WRF has a normal operating capacity of 3.15 mgd, with a final build-out capacity of 4.2 mgd and a peak operating capacity of 7.0 mgd. The City is currently generating approximately 2.0 mgd, so there is unused capacity at the facility to accept the incremental addition of 0.029 mgd that is anticipated from occupancy of the Specific Plan area. Therefore, the Project would have less than significant impacts to wastewater treatment capacity within the City.

Threshold: **Result in a determination by the wastewater treatment provider which serves or may serve the project that it has adequate capacity to serve the project's projected demand in addition to the provider's existing commitments?**

As provided in **Table 4.14-9, Estimated Wastewater Generation**, the estimated total wastewater generation for the full build-out of uses within the Specific Plan area is approximately 0.01 mgd.

**Table 4.14-9
Estimated Wastewater Generation**

Land Use	Building Square Footage	Wastewater Generation Rates	Total Daily Generation (mgd)
Commercial/Light Industrial	442,743.8	41.1 gpd/ksf	0.018
Light Industrial	196,978.3	41.1 gpd/ksf	0.008
		Total	0.026

*Notes: gpd = gallons per day; ksf = thousand square feet; mgd = million gallons per day.
Building square footage found by multiplying total area square footage by 0.35 FAR per the October 2016 Specific Plan.*

As noted previously, the WRF has a normal operating capacity of 3.15 mgd, with a final build-out capacity of 4.2 mgd and a peak operating capacity of 7.0 mgd. The City is currently generating approximately 2 mgd, so there is unused capacity at the facility to accept the incremental addition of 0.026 mgd from occupancy of the Specific Plan. The West Area 2 Expansion Area was included in the City's Wastewater System Master Plan as projected development within the City, with an estimated wastewater generation of 0.0818 mgd. Thus, the Project's estimated daily wastewater generation would be approximately 32 percent of the projected development potential for the West Area 2 Expansion. As the Project would not exceed the City's Wastewater System Master Plan projected capacity of the WRF, impacts would be less than significant.

The proposed Project's physical constraints and point of connection at the sewer main in Todd Lane will not accommodate a gravity line using standard allowable design slopes and good design practices. Therefore, a lift station is proposed for the system at the southeast corner of the Project Site. The lift station will be designed to the City of Santa Paula standards being automated with redundant pumps and adequate alarm systems. Complete design will be done during the Project improvement plan preparation.

The Specific Plan is proposing the best-fit alignment to connect to the existing 42-inch sewer main in Todd Lane, leading to the City of Santa Paula WRF. On site, the sewer will drain through one new 8-inch main running east-west along the southerly property line in Faulkner Road. The gravity system will continue toward Faulkner Road, through a new 12-inch casing pipe under State Route (SR) 126, and then south along the Todd drainage channel to a new lift station located at the northwest of Todd Lane at the channel. The proposed lift station will pump flows through the existing 6-inch force main located in Todd Lane. The existing 6-inch force main travels east underneath the existing 9-by-6-foot concrete box culvert and discharges to the existing 8-inch sewer in Todd Lane. This existing 8-inch sewer connects to the existing 42-inch sewer located in Todd Lane, which discharges to the City of Santa Paula WRF.

As concluded in the Sanitary Sewer Technical Report, the Project Site sewer system will be in accordance with the City of Santa Paula design guidelines. The Santa Paula West sewer system is in agreement with the design flows anticipated within the City's Wastewater Master Plan for this development. Also, the main backbone, will have additional capacity before reaching 50% pipe utilization of 253 gpm (0.564 cfs) for future connections and therefore there would be no impacts.

Threshold: Require or result in the construction of new storm water drainage facilities or expansion of existing facilities, the construction of which could cause significant environmental effects?

The Project Site is currently developed with agricultural uses as well as two residences and ancillary facilities for on-site agricultural operations. Implementation of the Specific Plan would result in the conversion of agricultural uses with urban development on the site, thus altering existing stormwater drainage on the Project Site.

Treatment systems incorporated into the Project design will be based on the treatment volume calculation guidelines provided in the Ventura County Water Quality Manual. The treatment types will include bioswales, bioretention cells, infiltration trenches, permeable pavement and/or detention basins as needed based on the proposed site plan layout. As a basis for design, the proposed Project must meet or not exceed the storm drainage requirements of the US Army Corps of Engineers (USACE), Ventura County Watershed Protection District (VCWWD), and the City of Santa Paula (on-site drainage systems) where applicable.

Drainage for the Specific Plan is presented in **Figure 2.0-14, Grading and Drainage Master Plan;** and the Storm Drain Plan is shown in **Figure 2.0-15, Storm Drain Plan.** Storm drain facilities would be sized to meet City of Santa Paula standards and accommodate the increased runoff generated by the increase in impervious surfaces on the Project Site. It should also be noted the development of the Project Site would occur in phases, as market conditions allow. Thus, the Project Site's storm drain plan may change throughout build-out of the site and would subsequently be subject to City approval.

The storm drain system would collect on-site runoff and direct most of it to three separate detention basins prior to outletting into storm drains that connect to the existing culverts under SR 126. The existing SR 126 culverts are exposed, but once the site is elevated by fill, the pipes would be underground and integrated into the new storm drain system. Peak flows would not exceed existing conditions, so there would not be adverse effects downstream.

The storm drain system includes a series of storm drain pipelines, detention basins, and a trapezoidal channel that will run along the Adams Barranca. One acre of land within the Project Site would be set

aside for detention basins totaling approximately 6 af of volume for detention and retention requirements. The basin along Adams Barranca would include debris catchment facilities to reduce debris from storm flows that have caused problems at the railroad culvert and the Caltrans culvert in this channel. These detention basins would serve dual roles of flood protection and water quality enhancement. The trapezoidal channel will be approximately 6 feet in depth, with a 15-foot bottom width and 2:1 side slopes that will accommodate flood waters in a large storm event and protect the buildings on site; in addition, the channel will remove a portion of the property from the floodplain through a LOMR (Letter of Map Revision) with the Federal Emergency Management Agency. The new channel would join with the existing Adams Barranca at the railroad crossing and the SR 126 crossing.

The detention basins will significantly reduce peak runoffs downstream by storing the peak event flows and lagging their release after the storm peak. The Project's proposed design features and drainage plan would not result in an increase in stormwater runoff from the site or exceed stormwater drainage requirements established by the USACE, VCWWD, or City. Impacts would be less than significant.

Threshold: **Have sufficient water supplies available to serve the project from existing entitlements and resources, or are new or expanded entitlements needed?**

Water Supply and Demand

At full build-out, the development under the Specific Plan would allow for the development of up to a total of approximately 1,264,982.4 square feet of commercial/light industrial uses and approximately 562,795.2 square feet of light industrial uses on the Project Site. Both of these land uses have a floor to area ratio (FAR) of 0.35 that would allow approximately 442,743.8 square feet of commercial/light industrial buildings and approximately 196,978.3 square feet of light industrial buildings. In addition, the boundary of the site adjacent to the Adams Barranca would be designated for approximately 4.9 acres of passive open space.

Demand for the proposed Project is approximately 39.8 afy (20.5 afy for Commercial/Light Industrial use, 1.5 afy for Light Industrial use, and 17.8 afy for landscape irrigation). The potable demand of 22 afy for the Commercial/Light Industrial and Light Industrial uses is 25 percent of the West Area 2 total supply allocation. The landscaped areas will be irrigated using reclaimed water to be delivered from the City's wastewater treatment plant.

The Project will replace existing agricultural uses on the site. As such, water currently used for agricultural irrigation will be used instead for Project consumption. Currently agricultural uses on the Project Site use approximately 281.1 afy (average over the past 5 years). As such, the Project's consumption will be a net reduction in total water use of 241.3 afy.

It should be noted that the West Area 2 Planning Area has been allocated a supply of ~~88.887.7~~ 87.7 afy based on future development.⁴⁰ The Project would use a portion of this allocation. However, with the removal of the agricultural uses currently on the Project Site, the Project can a portion of the existing water currently used for irrigation. It should be noted that that this portion of the pumped water will be pumped instead by the City from other wells, and not from the current well on site.

The Project will use reclaimed water (17.8 afy) that will be available from the City's wastewater treatment facility for irrigation; this will further reduce the demand on potable water supplies. The City forecasts having between 400 afy (~~2015~~2020) and 1,622,000 afy (204035) of reclaimed water available for use. The Project will require only a portion of the recycled water (~~2.94.4~~ percent in 2017 and ~~1.10.9~~ percent in 204035). As shown on **Table 4.14-10, Project Supply and Demand Comparison—Average Year (afy)**, shows the Project water demand as a percent of total supply throughout various milestones in the build-out schedule. By 2027 (build-out), the Project is estimated to demand 39.87 afy of water. Water demand from the Project based on the 2016 UWMP represents 0.61 percent of the City's total projected urban water demand in 2017, decreasing to 0.41 percent in 2037. The projected demand for the Project will account for only a small fraction of the projected demands.

~~Water demand from the Project represents 0.81 percent of City's total projected urban water demand in 2017, and decreasing to 0.65 percent in 2037.~~

The 20160 UWMP Update projects total water demands for the Santa Paula Business Park through 2035 2040 and demonstrates that supplies are sufficient to meet demands. The projected demand for the Project will account for only a small fraction of the projected demands. Therefore, there would be no impacts to available water supplies and no new or expanded entitlements are needed.

⁴⁰ City of Santa Paula, Final 2016 UWMP Update (August 2017), Table 3-2, 46 (1,905,750 square feet of development at 15 gal/sq. ft./year is 87.7 afy).

**Table 4.14-10

^f See Table 3 of the Water Supply Assessment.

^g See Table 2 of the Water Supply Assessment.

^h City of Santa Paula, 2010 Urban Water Management Plan (June 2011), Table 4-6, p. 47.

Threshold: Be served by a landfill with sufficient permitted capacity to accommodate the project's solid waste disposal needs?

Threshold: Comply with federal, state, and local statutes and regulations related to solid waste?

The Project would generate solid waste during construction. This waste would be generated as a result of the demolition of existing on-site structures, pavement, and agricultural waste as well as the construction of new commercial and light industrial development. Much of the solid waste generated from construction of the Project would be recyclable, such as wood and metal scrap and formed construction board (cement and drywall board). As provided by the SPMC, Section 50.140, Construction and Demolition Diversion, demolition and construction must divert 50 percent of waste tonnage from landfills. Separate calculations and reports are required for the demolition and construction portion of projects involving

both activities. Impacts related to construction solid waste generation are considered potentially significant.

All new development allowed within the Specific Plan will support recycling to reduce the amount of solid waste sent to the landfill. Waste carts for trash, recycling, and green waste would be provided. Estimates of the amount of solid waste that would be generated during operation have been calculated using the waste generation factors contained in the Ventura County Solid Waste Management Department Guidelines of Preparation of Environmental Assessments for Solid Waste Impacts, and are listed in **Table 4.14-11, Estimated Solid Waste Generation**.

**Table 4.14-11
Estimated Solid Waste Generation**

Land Use	Building Square Footage	Generation Rate	Solid Waste Generation (tons/year)	Solid Waste Generation (tons/day)
Commercial/Light Industrial	442,743.8	0.0024 tons/sq. ft./yr.	1,062.58	2.91
Light Industrial	196,978.3	0.0108 tons/sq. ft./yr. ^a	2,127.37	5.83
Total Solid Waste Generation			3,189.95	8.74

Source: Ventura County Solid Waste Management Department. Guidelines of Preparation of Environmental Assessments for Solid Waste Impacts. May 1998.

^a 0.0108 was used for Light Industrial since there is no generation rate for this type of use.

Notes: sq. ft. = square feet; yr. = year.

Building square footage found by multiplying total area square footage by 0.35 FAR per the October 2016 Specific Plan.

The Project Site currently generates approximately 4.08 tons of solid waste per year. Under the Specific Plan, future operations would generate approximately 3,189.95 tons of solid waste per year, which equates to approximately 8.74 tons of solid wastes per day that will be delivered to landfills.⁴¹ As mentioned previously, the Toland Road Landfill, due to its location and capacity, is the primary provider of solid waste disposal to the City of Santa Paula; other landfills in the region are also used but to a lesser extent. The Toland Road Landfill is permitted to accept a maximum of 1,500 tons of solid waste per day, with a remaining capacity of 21,983,000 cubic yards. The proposed Project would account for less than 1 percent of the Toland Road Landfill permitted daily capacity.

Additionally, the next closest landfills to the Project Site are the Chiquita Canyon Sanitary Landfill and Simi Valley Landfill & Recycling Center. The proposed Project would account for less than 1 percent of the maximum permitted daily capacity for these two landfills. However, the Chiquita Canyon Sanitary Landfill is only permitted through 2019. While there would be a substantial increase in generated solid waste on the Project Site, adequate landfill capacity appears to be available within the City and nearby landfills.

41 Toland Road Landfill is open 5 days per week, which is approximately 260 days per year. 3,189.95 tons/260 days = 12.27 tons/day.

Solid waste generated during construction and operation of the Project would be required to comply with all federal, state, and local statutes and regulations to reduce and recycle solid waste. Therefore, impacts would be less than significant.

As previously mentioned, the proposed Project would comply with AB 939 and AB 231 and the City's Construction and Demolition Diversion section of the Municipal Code, which states that demolition, construction, and remodeling shall divert 50 percent of waste tonnage from landfills. However, given that future landfill capacity may not be ensured through the life of the development of the Specific Plan, for many years after occupancy, impacts to solid waste would be potentially significant.

4.14.5 CUMULATIVE IMPACTS

Water

The 2016~~0~~ UWMP prepared for the City projects water demand within the City's service area through the year 2040~~35~~. The 2016~~0~~ UWMP analyzes future water demand at build-out conditions for normal, dry year, and multiple dry water years. As indicated in the analysis above, there is expected to be a surplus of water during normal, dry year, and multiple dry year scenarios. The Specific Plan's demand for water use would ~~meet~~ be consistent with the projected development demands within the City. Additionally, the Project would use less water than the existing agricultural operations. Therefore, the cumulative increase in water demand of related projects and build-out of the City pursuant to the General Plan is considered less than significant.

Wastewater

In association with the related projects identified in **Section 3.0, Related Projects**, the Specific Plan and related projects would result in a cumulative increase in projected wastewater flow within the City of Santa Paula. As shown in **Table 4.14-12, Cumulative Wastewater Generation**, the development of related projects would result in a generation flow of 2.36~~472~~ mgd at build-out. Combined with the net increase of approximately 0.01 mgd from the Project, the cumulative wastewater generation by the Specific Plan and related projects would be approximately 2.38~~274~~ mgd.

Table 4.14-12
Cumulative Wastewater Generation

Land Use	Unit	Wastewater Generation Rates	Total Daily Generation (mgd)
Residential	1,77086 units ^a	163 gpd/person ^b	1.0547
Commercial	2179,547298 sq. ft.	41.1 gpd/ksf ^b	0.009
Industrial	8957,474 sq. ft.	41.1 gpd/ksf ^b	0.0335

Notes: sq. ft. = square feet; ksf = thousand square feet; gpd = gallons per day; and afy = acre feet per year.

^a 3.63 persons/unit

^b From East Area 1 Amendment Supplemental EIR. Generation rate derived from the assumption that 80 percent of water demand is returned as wastewater per the 2010 City of Santa Paula Wastewater Master Plan

^c Blended per the 2016~~0~~ UWMP. Includes 495 residential units, 100,000 sq. ft. commercial/industrial/institutional, and 200 acres of parks and recreation land.

^d Blended per the 2016~~0~~ UWMP. Includes 450 dwelling units and 100,000 sq. ft. of commercial/industrial/institutional space, and 7 acres of parks and recreation land.

^e Blended per the 2016~~0~~ UWMP. Includes 1,602,000 sq. ft. of commercial/industrial/institutional space.

^f West Area 2 accounts for the entire 125 acre expansion area.

East Area 1 is added into residential, commercial and industrial as appropriate.

Zone 2 of the wastewater treatment service area would undergo various infrastructure improvements to handle the future wastewater flows with the development the West Area 2 and other existing and proposed uses within the zone. Development of the Specific Plan includes construction of a new lift station at the intersection of Beckwith Road and Faulkner Road at the southeast corner of the Specific Plan area, north of SR 126. Completion of proposed Project improvements would convey most of the wastewater flow to the POC along the existing sewer lines north of the site along Telegraph Road. In addition, the WRF has been designed to accept wastewater from the cumulative growth of the City under the General Plan, including all related projects. As such, the Project's contribution to cumulative wastewater system and treatment impacts would be less than significant.

Solid Waste

Development under the Specific Plan and the related projects would add incremental increases in solid waste disposal at landfills located within Ventura County. Approximately 12 years of capacity remain at the Toland Road Sanitary Landfill, 4 years at the Chiquita Canyon Sanitary Landfill, 37 years at the Simi

Valley Landfill & Recycling Center, 10 years at the Azusa Land Reclamation Co. Landfill, 27 years at Antelope Valley Public Landfills I and II, and 23 years at the Bakersfield Metropolitan (Bena) Solid Waste Landfill. .

Assuming that all of the expansion areas and other probable future developments are completely built out according to the City's General Plan, the cumulative solid waste generation would total ~~58,788,602~~ **58,788,602,216** tons per year, as shown in **Table 4.14-13, Estimated Cumulative Solid Waste Generation**. The Specific Plan would account for approximately ~~58~~ percent of the City's future estimated cumulative solid waste generation.

**Table 4.14-13
Estimated Cumulative Solid Waste Generation**

Land Use	Unit	Solid Waste Generation Rates	Solid Waste Generation (tons/day)	Solid Waste Generation (tons/year)
Residential ^a	1,770 86 units ^b	0.00612 tons/household/day	10.8 93	2,842 3,953
Commercial ^a	219,547 sq. ft. 217,298 sq. ft.	0.0025 tons /1000 sq. ft./day	0.55 4	141 201
Industrial ^a	857,474 sq. ft. 805,474 sq. ft.	0.0025 tons/1000 sq. ft./day	2.1 401	524 781
East Gateway Project ^c	-		39.5	10,275
Fagan Canyon ^d	-		6.9	1,798
Adams Canyon ^d	-		5.0	1,291
West Area 2 ^{de}	-		24.9	6,480
Existing City uses ^d	-		113.6	29,531
Other City build-out ^f	-		22.7	5,906
Total			226.1208	58,7886022,216

Source: Ventura County Solid Waste Management Department, *Estimated Solid Waste Generation Rates for Industrial/Commercial/Residential Establishments, Guidelines for Preparation of Environmental Assessments for Solid Waste Impacts*.
<https://www2.calrecycle.ca.gov/WasteCharacterization/General/Rates>

Note:

Tons per year were determined using the Toland Road Landfill number of operational days within a year (260 operational days).

^a Land uses include development from East Area 1.

^b 3.63 persons/unit

^c East Gateway Project solid waste generation was determined by the East Gateway Draft EIR.

^d Data from East Area 1 Specific Plan Amendment Supplemental EIR.

^e West Area 2 includes entire 125 acre expansion area.

^f Other build-out assumes 20 percent of solid waste generated by existing uses to account for all other probable future projects identified in the City's Development Activity List.

The City would continue to implement programs for source reduction and recycling and require that subsequent projects complete environmental review to minimize solid waste disposal at the six disposal facilities. Furthermore, the State has set a goal to recycle, source-reduce, or compost 75 percent of solid waste generated.

The City would utilize the Toland Road Sanitary Landfill until the landfill reaches capacity. At the time Toland Road Sanitary Landfill closes, the City would utilize the capacity of the five remaining landfills previously used for solid waste disposal. The combined remaining capacity of the five landfills is estimated to last for 95 years, or an average of 19 years.

As such, cumulative impacts would be less than significant because the six landfills discussed above have sufficient capacity for decades to service the development of the Specific Plan and other development requiring solid waste disposal.

4.14.6 MITIGATION MEASURES

The following measures have been identified to mitigate the identified solid waste impacts.

SW-1 Before issuance of a demolition permit or construction permit, the applicant must implement waste reduction and recycling programs to divert construction solid waste from the area landfill. A construction recycling plan must be submitted and approved by the Director of Public Works. A final report as to the amount recycled must be provided to the Director of Public Works at the completion of construction activities documenting the waste reduction efforts conducted, including a listing of solid waste diversion amounts, and the amount of waste sent to landfills. The report must also document how the construction contractor complied with applicable state and local statutes and regulations to reduce and recycle solid waste generated during construction.

4.14.7 RESIDUAL IMPACTS AFTER MITIGATION

Implementation of **Mitigation Measure SW-1** would reduce impacts to utilities and services to less than significant levels.

RE: Agricultural Conservation Easement Survey

On behalf of McGaelic Group LP and Bender Farms, which own approximately 49 acres of agricultural land on the westerly boundary of the City of Santa Paula now in the process of being annexed, zoned and developed into a business park, Parkstone Companies is conducting a survey to see if any owners of other prime agricultural lands in Ventura County are interested in selling an Agricultural Conservation Easement for the purpose of forever waiving development rights on their land, thereby partially mitigating the loss of this farm land to development. It would be greatly appreciated if you could please forward this letter to any of your clients who own prime agricultural land in Ventura County and see if they would be willing to participate in the survey. Doing so would be very help in giving guidance as to the extent of any interest by land owners in participating in this sort of transaction. All that need be done is to have the land owner fill in the blanks below and return this letter.

Currently, LAFCO staff is planning on recommending to the LAFCO Board that it condition annexation on the owner mitigating the loss of farm land to development by requiring that equal or greater acreage in Ventura County be subjected to Agricultural Conservation Easements. We are therefore attempting to determine the extent, if any, of interest by land owners in granting such easements.

**RE: Santa Paula West – Building Sizes
Santa Paula, California**

Dear Mike and Chad:

We talked about my concerns related to requiring smaller buildings on the Santa Paula West property. Tenants in the market can range from 10,000 sf up to 200,000 sf. Even larger in some cases. Limiting the maximum size of any individual building to 30,000 sf would drastically limit our ability to lease or sell the properties as we won't be able to respond to a large number of potential tenants. In addition, limiting the clear height would also be a "deal killer" for most tenants. In today's market, low clear height buildings do not lease as quickly and for most tenants, it would immediately remove that property from consideration. We are in an ecommerce era with most companies needing a minimum of 24' clear under the beam at the lowest point of the warehouse on up to 30' and even 32' clear.

For example, one of Santa Paula's largest tenants is Calavo. One of Calavo's competitors is Mission Produce in Oxnard. Mission recently finished a 200,000 sf cooler building that is 30 foot clear. If Calavo ever wants to expand and this limitation is enacted, they will have to relocate to another city in order to compete in their industry. Limoneira would be in a very similar situation.

Economically, this would mean it will take significantly longer to locate potential buyers and tenants putting the project at a huge disadvantage vs. competing properties in the neighboring cities. Since Time is the downfall of many real estate projects, limiting the size of buildings in the Santa Paula West project could cause the project severe economic damage.

Please let me know if you have any questions.

Sincerely,

Douglas H. Shaw, Jr.

EXECUTIVE SUMMARY

The purpose of this water supply assessment (WSA) is to document the sufficiency of the local water supply to meet the demand of development that could occur under the Santa Paula West Business Park Specific Plan (“Specific Plan” or “Project”). The Specific Plan area (“Project Site”) covers an area of approximately 53.81 acres of the West Area 2 Expansion Area of the City of Santa Paula’s General Plan. The Project includes the annexation of the Specific Plan area into the incorporated City limits. The Project includes a series of related actions, such as an amendment to the City’s General Plan Land Use Element and the zoning designations from the rezoning of the annexation area.

The Project land use designations, zoning, development standards, and other related land use specifications will govern future permitting of developments within the Specific Plan area. The Specific Plan designates the Project Site for light industrial and commercial uses, which is consistent with existing City rezoning and General Plan designations. These designations allow for the development of land uses consistent with offices, manufacturing, research and development, professional office, and limited commercial retail uses. Under the Specific Plan, these land use areas designated for development are integrated into one cohesive business park type of layout, complete with vehicular circulation, pedestrian walkways, and utility infrastructure.

The City’s General Plan requires the preparation and adoption of a Specific Plan for any identified expansion area prior to the City initiating annexation of the area to the City. Prior to considering the proposed Specific Plan for approval, the City is required to comply with the California Environmental Quality Act (CEQA). The City is currently preparing an Environmental Impact Report (EIR) to comply with CEQA.

The California Water Code (Sections 10910 through 10915) requires the preparation of a WSA by the public water system supplier that would provide water to the proposed project for all projects as defined in Section 10912 of the Water Code. This includes any mixed-use project including commercial space with a floor area greater than 250,000 square feet. The goal of a WSA is to provide information on the availability of water supplies to be included in EIRs.

The City of Santa Paula Public Works Department, Water Division, provides water service in the City of Santa Paula and would provide water service to the proposed Project after annexation of the site to the City. Currently, the Santa Paula Groundwater Basin (“Santa Paula Basin”) is the City’s sole source of water supply. Rights to withdraw groundwater from the Santa Paula Basin have been adjudicated, and the Santa Paula Basin is managed in accordance with this adjudication to ensure a safe groundwater yield. Recent

demand for water for the existing agricultural and associated uses on Santa Paula West Specific Plan site has averaged approximately 281.1 acre-feet per year (afy).

The eastern boundary of the Santa Paula Basin also demarcates the western boundary of the Fillmore Groundwater Basin (“Fillmore Basin”), which is generally located to the northeast of the Santa Paula Basin and upstream in relation to the Santa Clara River, which flows across both basins.

The City is required under California Water Code (Sections 10610 to 10656) to assess citywide water supply and demand during the next 20 years in 5-year increments in its Urban Water Management Plan (UWMP). The City completed its 2016 UWMP Update in 2017. The 2016 UWMP addresses water planning, including recycled water planning during a 20-year period in 5-year increments; identifies and quantifies adequate water supplies for existing and future water demands in normal, dry, and multiple dry years; identifies actions to prepare for and implement during a catastrophic interruption of water supplies; and implements conservation and efficient use of urban water supplies. No decrease in availability of groundwater supplies is anticipated through the year 2040.

Conservative assumptions concerning future water demand are used in this WSA. The City’s 2016 UWMP provides per capita and specific use (commercial, industrial, and residential) demand rates for estimating future water demand. This WSA utilizes the commercial and industrial rates provided in the UWMP.

The City has constructed a new Water Recycling Facility (WRF). The City WRF will produce recycled water that meets California Title 22 regulations. The WRF has a permitted dry-weather capacity of 4.2 million gallons per day (mgd) and a permitted wet-weather (also maximum) capacity of 8.0 mgd. Recycled water is anticipated to be available for irrigation of landscape areas in 2020.

To estimate water demand for the type and amount of land uses that would be permitted by the proposed Project, the water demand factors contained in the City’s 2016 UWMP were used. Based on these factors, the annual average water demand for the proposed Project is approximately 39.7 afy (20.4 afy for Commercial/Light Industrial use, 1.5 afy for Light Industrial use, and 17.8 afy for landscape irrigation).

The estimated supply for West Area 2 per the 2016 UWMP Update is 87.7 afy.¹ The potable demand of 21.9 afy for the Commercial/Light Industrial and Light Industrial uses is 25 percent of the West Area 2 total supply estimation. The landscape areas will be irrigated using recycled water to be delivered from the City’s wastewater treatment plant.

1 City of Santa Paula, *Final Urban Water Management Plan [UWMP] 2016 Update* (August 2017), 46, Table 3-2 (1,905,750 square feet of development at 15 gal/sq ft/year is 87.7 afy).

The Project will replace existing agricultural uses on the site. As such, water currently used for agricultural irrigation will be used instead for Project consumption. Currently, agricultural uses on the Project Site use approximately 281.1 afy (average during the past 5 years; see **Table 3**). As such, the proposed Project's consumption will be a net reduction in total water use of 241.4 afy (281.1 afy current agricultural water use less 39.7 afy projected water use equals 241.4 afy net reduction in water use).

It should be noted that the West Area 2 Planning Area has an estimated supply of 87.7 afy based on future development. The proposed Project could utilize a portion of this allocation. However, with the removal of the agricultural uses currently on the Project Site, the Project can a portion of the existing water currently used for irrigation. Existing wells will be utilized for construction water as the site is graded, in accordance with the Specific Plan, and then will be abandoned pursuant to state and local regulations.

The Project will use recycled water (17.8 afy) that will be available from the City's wastewater treatment facility for irrigation; this will further reduce the demand on potable water supplies. The City's 2016 UWMP forecast having between 400 afy (2020) and 2,000 afy (2040) of recycled water available for use (see **Table 13**). Based on these forecasts, the Project will require only a portion of the recycled water (4.45 percent in 2020 and 0.89 percent in 2040).

The Santa Paula West Business Park recycled water system would operate via a proposed 12-inch distribution main called for by the City's Recycled Water Plan. This will allow the project to use recycled water when the City extends a recycled water line to the site and the plant is producing sufficient recycled water to supply the site.

In accordance with the City of Santa Paula Municipal Code, landowners or developers are required to either provide water rights sufficient to serve the property or pay an equivalent in-lieu fee as a condition of project approval or when the property is annexed. Upon annexation, the applicants will transfer a portion of these rights in sufficient quantity to meet all the anticipated water demands of the project.

In summary, this Water Supply Assessment for the proposed Project concludes that the City of Santa Paula's projected water supply for the 20-year period from 2017 to 2037 is adequate to meet the demand projected for the project, existing and planned future uses in the City in normal, single dry, and multiple dry years.

1.0 INTRODUCTION

The environmental review of the proposed Project is being prepared in compliance with the California Environmental Quality Act (CEQA) process. The City of Santa Paula (“City”), the Public Water System (PWS) for the proposed Project, has determined that a water supply assessment (WSA) is necessary to complete the proposed Project’s CEQA process.

1.1 PURPOSE OF DOCUMENT

The purpose of this water assessment is to document the sufficiency of the local water supply to meet the demand associated with the proposed land uses of the Santa Paula West Business Park Specific Plan (proposed Project). It should be noted that this WSA addresses the overall water supply available to the City to meet the demands of existing customers and other future demands.

Adequacy of the delivery system is addressed in the City’s Final 2016 Urban Water Management Plan Update (Final 2016 UWMP Update). The WSA reviews and makes a finding of reasonable sufficiency of water supplies that either are available or will be available to the City to meet future demand. The California Water Code requires a determination for a 20-year period (2017–2037) from the start of project development.

1.1.1 Water Supply Assessment

Requirements for the preparation of a WSA are set forth in Section 10910 of the California Water Code (“Water Code”) in accordance with SB 610, which was enacted in 2001 and became effective January 1, 2002. The Water Code requires a WSA be prepared for any project that would consist of one or more of the following:

- A proposed residential development of more than 500 dwelling units
- A proposed shopping center or business establishment employing more than 1,000 persons or having more than 500,000 square feet of floor space
- A proposed commercial office building employing more than 1,000 persons or having more than 250,000 square feet of floor space
- A hotel or motel with more than 500 rooms
- An industrial, manufacturing or processing plant, or industrial park planned to house more than 1,000 people, occupying more than 40 acres of land, or having more than 650,000 square feet of floor area
- A mixed-use project that includes one or more of the projects specified above
- A project that would demand an amount of water equivalent to, or greater than, the amount of water required by a 500-dwelling unit project

- For public water systems with fewer than 5,000 service connections, a project that meets the following criteria:
 - A proposed residential, business, commercial, hotel or motel, or industrial development that would account for an increase of 10 percent or more in the number of a public water system’s existing service connections
 - A mixed-use project that would demand an amount of water equivalent to, or greater than, the amount of water required by residential development that would represent an increase of 10 percent or more in the number of the public water system’s existing service connections

The proposed development is a “project” as defined by Water Code Section 10912 and requires a WSA because it consists of an industrial park occupying more than 40 acres of land.

Section 10657 of the California Water Code requires cities and counties to request specific information on water supplies from the PWS that would serve any project that is subject to CEQA and is defined as a project in Water Code Section 10912. This information is to be incorporated into the environmental review document prepared pursuant to CEQA.

1.2 LOCATION

1.2.1 Regional Setting

The Santa Paula West Business Park Specific Plan area is directly adjacent to the western boundary of the City of Santa Paula, within the City Urban Restriction Boundary (CURB) of the City.

The City encompasses 4.5 square miles of incorporated area located approximately 17 miles inland from the Pacific Ocean in central Ventura County, as shown in **Figure 1, Regional Location Map**. The City lies within the Santa Clara River Valley, approximately 12 miles east of the City of San Buenaventura and approximately 9 miles west of the City of Fillmore.

SOURCE: Meridian Consultants – 2015

FIGURE 1

Regional Location Map

1.2.2 Community Setting

The Project Site is bound to the north by Telegraph Road, to the east by existing industrial and commercial development in the existing Santa Paula city limits, to the south by agriculture, and to the west by the Adams Barranca.

The Santa Paula West Business Park is located within the CURB of the City of Santa Paula, with frontage along State Route 126 and Telegraph Road, and is bisected by the railroad right-of-way as illustrated on **Figure 2, Project Location Map**. While it is just west of the Santa Paula City limits, it is within the City of Santa Paula Sphere of influence (SOI), and is outside of the Santa Paula–Ventura Greenbelt. Annexation of the Santa Paula West Business Park into the City of Santa Paula is planned to occur as part of the Specific Plan approval process.

1.3 PROJECT DESCRIPTION

1.3.1 Specific Plan Overview

The proposed Project consists of a specific plan for 53.81 acres of area located within the City's SOI. The uses envisioned within the Santa Paula West Business Park will be a mix of low-intensity industrial (such as light manufacturing or research and development), professional office, and supporting commercial businesses that are currently permitted in the Commercial/Light industrial and Light Industrial Zones of the City of Santa Paula.

The Santa Paula West Business Park Specific Plan would be adopted by the City, which would approve any request for annexation into the City. The Specific Plan would establish the necessary plans, development standards, regulations, infrastructure requirements, design guidelines, and implementation programs on which subsequent Project-related development activities would be founded.

It is intended that local public works projects, design review plans, detailed site plans, grading and building permits, or any other action requiring ministerial or discretionary approval applicable to the Project Site would be consistent with the Specific Plan.

The 20-year scenario is used to illustrate total Project demand within the required 20-year WSA time frame (2017-2037) established by SB 610.

1.3.2 Land Use Plan

The proposed Project would be a mix of low-intensity industrial (such as light manufacturing or research and development), professional office, and supporting commercial businesses that are currently permitted in the Commercial/Light industrial (C-LI) and Light Industrial Zones (LI) of the City of Santa Paula. These uses would cover approximately 41.96 acres, as shown in **Figure 3, Zoning Implementation Plan**.

In addition, the Project would have approximately 4.9 acres of open space and approximately 6.95 acres of roadways that would not require any use of water. The Project Site would total approximately 53.81 acres, as shown in **Table 1, Land Use Summary**.

Table 1
Land Use Summary

Land Use Type	Acres	Percent of Site
Commercial/Light Industrial	41.96	78.0%
Roadways (Approximate)	6.95	12.9%
Open Space/Passive	4.90	9.1%
Gross Area of SP West BP	53.81	100.0%

The Santa Paula West Business Park Specific Plan includes lists of permitted uses, including those permitted without any conditions and those that require conditional use permits (CUPs) and public use permits. All development within the Santa Paula West Business Park will adhere to the standards of the Specific Plan.

1.3.3 Water and Wastewater

Public Water Supply

Surface water and groundwater resources within the City of Santa Paula are managed by the United Water Conservation District. However, the City is responsible for water supply and distribution within its 4.5-square-mile service area. The Project is located outside of the City's corporate boundary but within the West Area 2 identified in the General Plan for future expansion. A portion of the Project area is currently located in the City's water service area, and the entire site would be located within the City's service area after annexation of the site to the City.

As of 2015, the City had approximately 7,400 connections, and total demand within the City was 3,907 acre-feet (af).² The City does not generally provide wholesale water to any other agencies nor sell water to customers outside the City's service area. However, in 2010 the City provided 39 af to the Middleroad Mutual Water Company, and 44 af in 2015. The City does not use potable supplies for saline barriers, groundwater recharge, conjunctive use, raw water, or recycled water uses.³

Development in the City has been dependent on groundwater as a source of supply. However, the demand for groundwater is within the limits of natural recharge of the Santa Paula Basin.

FIGURE 3

Potable Water

The City of Santa Paula would provide water service for the Project Site. Existing wells will be utilized for construction water as the site is graded, in accordance with the Specific Plan, and then will be abandoned pursuant to state and local regulations.

As shown on **Figure 4, Conceptual Domestic and Recycled Water Plan**, the system for the Specific Plan domestic water system would operate entirely within the City's 200 Zone, and would receive water via proposed 12-inch distribution mains as called for in the City's Potable Water System Master Plan. The points of connection (POCs) for the Project will be at Faulkner Road and Telegraph Road. The existing 8-inch ACP located in Beckwith Road will remain in place.

From the POC, a new 12-inch line will proceed north through the proposed Project. The proposed potable distribution system will comprise 8-inch through 12-inch mains. The water mains located in Beckwith Road, Road "A," and Faulkner Road will be publicly owned and maintained, while the remaining on-site domestic water and fire lines be master metered.

Irrigation and Fire Suppression System

A water system analysis would be prepared during the final construction documents to ensure that the required fire flow is provided at each fire hydrant and each fire sprinkler system. Every building would be required to provide an approved fire sprinkler system.

Wastewater

The City of Santa Paula would provide service for the Project Site. The City's wastewater system includes more than 50 miles of sewer lines and the new City Water Recycling Facility (WRF).

The average daily flow rate for the City WRF during the period from 2010 through 2015 is 1.85 mgd. The annual average daily flow in 2015 was 1.75 mgd. Projected wastewater flow to the City's WRF is nearly 2,400 afy for the year 2040, based on normal water-year data, current wastewater flow, and new potential wastewater flows.⁴

There is no existing sewer system in the Santa Paula West Business Park Specific Plan area. The City's *Wastewater System Management Plan* identifies a new off-site mainline that will need to be completed prior to implementation of the Specific Plan. These improvements would bring the POC for sewer service for the Santa Paula West Business Park to north along Faulkner Road at the southeast corner of the Santa Paula West Business Park area. **Figure 5, Conceptual Sewer Plan**, identifies the lines, directions, and points of connection.

⁴ City of Santa Paula, *Final UWMP 2016 Update* (August 2017), 76.

1.4 PROJECT SPECIFIC WATER DEMAND

To estimate water demand for the type and amount of land uses that would be permitted by the proposed Specific Plan, the water demand factors contained in the City's 2016 UWMP Update were used.

The unit water usage for this WSA are based on indoor water use performance standard as provided in the California Water Code for residential water demand; the American Water Works Association Research Foundation for commercial water demands; and the City's Landscape Ordinance, which meets the water conservation goals of the California Department of Water Resources (DWR) Model Water Efficient Landscape Ordinance. The overall goal of the ordinance is to reduce landscape water use; reduce or eliminate runoff in streets; and limit turf.

The Project planning area includes a total of 53.81 acres within West Area 2 in the City's Planning Area. To provide a more accurate estimate of the proposed Project's water demand, a site-specific analysis was completed. Potable water demand was calculated for all uses based on Project-specific estimates.

The projected water demands are distinguished between indoor and outdoor usage. **Table 2, Estimated Project Water Demands**, summarizes the indoor water demands of the residential portion of the Project.

Table 2
Estimated Project Water Demands

Land Use	Sq. Ft./ Acreage	Demand Rate ^a	Annual Demand (afy)
Commercial/Light Industrial ^b	442,743.8	15 gal./sq. ft./yr.	20.4
Light Industrial ^b	196,978.3	2.49 gal./sq. ft./yr.	1.5
Landscaped areas ^c	8.1	2.2 AF/acre/yr.	<u>17.8</u>
Total Estimated Demand			39.7

Notes: afy = acre-feet per year; gal./sq. ft./yr. = gallons per square foot per year.

^a Demand Rates per City of Santa Paula, Final 2016 UWMP Update (August 2017), 46, Table 3-2.

^b Building square footage for C-LI and LI land uses found by multiplying total area square footage by 0.35 FAR per the October 2016 Specific Plan.

^c Landscaped areas assume 15% of total area or 8.07 acres per the October 2016 Specific Plan.

FIGURE 5

The estimated supply to West Area 2 per the Final 2016 UWMP Update is 87.7 afy.⁵ The estimated potable demand for the proposed Project is approximately 25 percent of the West Area 2 total supply.⁶ The landscaped areas will be irrigated using recycled water to be delivered from the City's wastewater treatment plant. Construction is expected to begin in 2017 and be completed by 2020.

The Project will replace existing agricultural uses on the site. As such, a portion of the water currently used for agricultural irrigation will be used instead for Project consumption.

In addition to the previously described City-specific water conservation measures, Project developers shall be required to implement the following features to assure the most efficient use of water resources throughout the life of the Project:⁷

- Develop a budget for landscape irrigation use, pursuant to Section 5.304.1 of the City's Municipal Code.
- For new water service or for addition or alteration requiring upgraded water service for landscaped areas of at least 1,000 square feet but not more than 5,000 square feet (the level at which Water Code Section 535 applies), separate submeters or metering devices shall be installed for outdoor potable water use.
- Automatic irrigation system controllers (weather with rain sensors or soil moisture based) installed at the time of final inspection.
- All planted landscape areas within the Santa Paula West Business Park will have irrigation systems that are fully automatic and employ the latest "Low Volume" water conservation design criteria. No overspray of irrigation water onto walkways, common area hardscape areas, or any architectural walls will be allowed.
- Landscape plant and tree materials will be chosen for aesthetic quality and will consist of at least 75 percent low maintenance, California or drought tolerant, and ability to retain and treat storm water runoff.

1.5 REGULATORY SETTING

1.5.1 California Department of Water Resources

The DWR released its *State Water Project Final Delivery Capability Report* ("Report") in July 2015. The Report updates the estimated water delivery capacity of the State Water Project (SWP) for current conditions and two decades from 2015.⁸ The estimates include the best-known future effects of climate

5 City of Santa Paula, *Final UWMP 2016 Update* (August 2017), 46, Table 3-2 (1,905,750 square feet of development at 15 gal/sq ft/year is 87.7 afy).

6 Estimated potable water demand is approximately 21.9 afy, total estimated water demand for West Area 2 is 87.7 afy.

7 California Green Building Code (2013), tit. 24, pt. 11, Revision Record for the State of California (July 1, 2015).

8 Department of Water Resources (DWR), *The State Water Project Final Delivery Capability Report 2015* (July 1, 2015), <https://msb.water.ca.gov/documents/86800/144575dd-0be1-4d2d-aeff-8d7a2a7b21e4>.

change and the anticipated changes in Sacramento River basin land uses. The assessment of current and future SWP reliability allows DWR to plan for reliable future water supplies in California.

1.5.2 Comprehensive Water Legislation

In November 2009, four legislative bills (SBX7-1, SBX7-6, SBX7-7, and SBX7-8) and the supporting bond bill (SBX7-2), creating a comprehensive water package designed to meet California’s water challenges, were approved by then-governor Arnold Schwarzenegger.⁹ The legislation establishes the governmental framework to achieve the co-equal goals of providing a more reliable water supply to California and restoring and enhancing the San Francisco Bay/Sacramento–San Joaquin Delta Estuary (“Bay-Delta”) ecosystem. The package includes requirements to improve the management of our water resources by monitoring groundwater basins, developing agricultural water management plans, reducing statewide per capita water consumption 20 percent by 2020, and reporting water diversions and uses in the Delta. It also appropriates \$250 million for grants and expenditures for projects to reduce dependence on the Delta if the bond issue is approved by the voters in the future.

The Safe, Clean, and Reliable Drinking Water Supply Act of 2010 (SBX7-2) was placed and passed on the November 2014 ballot as California Proposition 1, the Water Bond (Assembly Bill [AB] 1471). AB 1471 provides funding for California’s aging water infrastructure, as well as for projects and programs to improve the ecosystem and water supply reliability for California. The bond bill includes \$2.7 billion for actions improving Bay-Delta sustainability. These investments will help to reduce seismic risk to Bay-Delta water supplies, protect drinking water quality, and reduce conflict between water management and environmental protection.

Part of the comprehensive water package included SBX7-7 (Steinberg, Chapter 4, Statutes of 2009—Statewide Water Conservation). This bill creates a framework for future planning and actions by urban and agricultural water suppliers to reduce California’s water use. SBX7-7 requires the development of agricultural water management plans and requires urban water agencies to reduce statewide per capita water consumption 20 percent by 2020.

9 DWR, *California Water Plan Update 2009*, vol. 4 (December 2009); Reference Guide, Legislation, 2009 Comprehensive Water Package, Special Session Policy Bills and Bond Summary (November 2009).

1.5.3 Recent Regulations, Executive Orders and SWRCB Actions

Executive Orders

On January 17, 2014, Governor Brown declared a drought state of emergency.¹⁰ On April 25, 2014, the governor signed Executive Order (EO) B-26-14¹¹ (April 2014 Proclamation) stating, among other things, that

severe drought conditions continue to present urgent challenges: water shortages in communities across the state, greatly increased wildfire activity, diminished water for agricultural production, degraded habitat for many fish and wildlife species, threat of saltwater contamination of large fresh water supplies conveyed through the Sacramento-San Joaquin Bay Delta, and additional water scarcity if drought conditions continue into 2015.

On December 22, 2014, Governor Brown issued EO B-28-14,¹² which extended the suspension of certain activities subject to CEQA contained in the January 2014 and April 2014 Proclamations, including the State Water Resources Control Board (SWRCB) adoption of emergency regulations, pursuant to Water Code Section 1058.5, through May 31, 2016. On March 17, 2015, the SWRCB adopted an expanded emergency conservation regulation prohibiting certain irrigation practices, restricting certain commercial activities, and ordering all urban water suppliers to implement mandatory restrictions on outdoor irrigation. The emergency regulation orders larger urban water suppliers—those providing water for municipal purposes to more than 3,000 customers or supplying more than 3,000 af of water annually, excluding wholesalers—to provide monthly data on water production, enforcement, and outdoor water conservation measures being implemented.

On April 1, 2015, Governor Brown signed EO B-29-15,¹³ directing the SWRCB to impose restrictions to achieve a statewide 25 percent reduction in potable urban water usage, compared to the amount used in 2013, through February 2016. The governor instructed the SWRCB to consider the relative per capita water usage of each supplier's service area and to require those areas with high per capita use to achieve proportionally greater reductions than those with low use. The order mandated that the governor's

11 Office of the Governor, "Governor Brown Issues Executive Order to Redouble State Drought Actions" (April 25, 2014), <http://gov.ca.gov/news.php?id=18496>.

12 Office of the Governor, "Executive Order B-28-14" (December 22, 2014), <https://www.gov.ca.gov/news.php?id=18815>.

13 State of California, Executive Department, "Executive Order B-29-15" (April 1, 2015), http://gov.ca.gov/docs/4.1.15_Executive_Order.pdf.

January 17, 2014, Proclamation, his April 25, 2014, Proclamation, EO B-26-14, and EO B-28-14 remain in full force and effect except as modified.

As of April 7, 2017, the State of California Drought Emergency¹⁴ has been lifted by Governor Brown due to increased rainfall. However, the governor retained the prohibition on wasteful practices, and conservation will continue to be required. Based on the only dialogue occurring with the SWRCB, conservation is expected to become more stringent through the years.

State Water Resources Control Board

In 2014, the SWRCB determined that an emergency existed due to severe drought conditions and that adoption of the proposed emergency regulation was necessary to address the emergency.

On May 5, 2015, the SWRCB adopted an emergency conservation regulation in accordance with the governor's directive. The provisions of the emergency regulation went into effect on May 18, 2015.¹⁵ The emergency regulation identifies how much water communities must conserve based on their average residential water use, per person per day, last summer. Every person should be able keep indoor water use to no more than 55 gallons per day. For the most part, the amount of water that each person uses in excess of this amount is water that is applied to lawns and other ornamental landscapes.

To reduce water use by 25 percent statewide, a regulation adopted by the SWRCB places each urban water supplier into one of eight tiers, each of which is assigned a conservation standard, ranging between 4 and 36 percent.¹⁶

As of March 2016, the City of Santa Paula had a Conservation Standard of 26 percent as directed by the SWRCB; from March to June 2016, the City had achieved 24.2 percent water savings. The Governor issued a new EO as of June 1, 2016, reducing the Conservation Standards as a result of improved conditions, and the City now has a zero percent conservation standard.¹⁷

Legislative Actions

Sustainable Groundwater Management Act

In September 2014, Governor Edmund G. Brown Jr. signed a three-bill package known as the Sustainable Groundwater Management Act (SGMA). The legislation allows local agencies to customize groundwater sustainability plans to their regional economic and environmental needs. SGMA creates a framework for sustainable, local groundwater management for the first time in California history. Moreover, SGMA empowers local agencies to adopt groundwater management plans that are tailored to the resources and needs of their communities.

The three bills that make up SGMA are AB 1739 (Dickinson), SB 1168 (Pavley) and SB 1319 (Pavley).

AB 1739—Groundwater Management

AB 1739 (Dickinson) authorizes the DWR or a groundwater sustainability agency (GSA) to provide technical assistance to entities that extract or use groundwater to promote water conservation and protect groundwater resources. This bill requires the DWR, by January 1, 2017, to publish on its Internet website best management practices for the sustainable management of groundwater, and requires the DWR to prepare and release a report by December 31, 2016, on the agency's best estimate of water available for replenishment of groundwater in the state.

AB 1739 requires a GSA to submit a groundwater sustainability plan (GSP) to DWR for review upon adoption. The bill authorizes a local agency to submit to DWR for evaluation and assessment an alternative that the local agency believes satisfies the objectives of these provisions. AB 1739 also requires DWR to review any of the above-described submissions at least every 5 years after initial submission to DWR.

In addition, AB 1739 requires that prior to the adoption or any substantial amendment of a general plan, the planning agency review and consider a GSP; groundwater management plan; groundwater management court order, judgment, or decree; adjudication of water rights; or a certain order or interim plan by the SWRCB. AB 1739 requires the planning agency to refer a proposed action to adopt or substantially amend a general plan to any GSA that has adopted a GSP or local agency that otherwise manages groundwater, and to the SWRCB if it has adopted an interim plan that includes territory within the planning area.

SB 1168—Groundwater Management

SB 1168 (Pavley) notes that the policy of the state is that groundwater resources be managed sustainably for long-term reliability and multiple economic, social, and environmental benefits for current and future beneficial uses. This bill states that sustainable groundwater management is best achieved locally through the development, implementation, and updating of plans and programs based on the best available science.

SB 1168 requires DWR to categorize each basin as high, medium, low, or very low priority. The initial priority for each basin was to be established no later than January 31, 2015. The bill authorizes a local agency to request that DWR revise the boundaries of a basin and required DWR to adopt by January 1, 2016, regulations on the methodology and criteria to be used to evaluate the proposed revision.

In addition, all groundwater basins designated as high- or medium-priority basins by the DWR that are designated as basins subject to critical conditions of overdraft are to be managed under a GSP or coordinated GSPs by January 31, 2020; all other groundwater basins designated as high- or medium-priority basins are to be managed under a GSP or coordinated GSPs by January 31, 2022.

This bill would authorize any local agency, as defined, or combination of local agencies to elect to be a GSA and would require, within 30 days of electing to be or forming a GSA, said agency to inform the DWR of its election or formation and its intent to undertake sustainable groundwater management.

SB 1319—Groundwater

SB 1319 (Pavley) prohibits the SWRCB from establishing an interim plan to remedy a condition where the groundwater extractions result in significant depletions of interconnected surface waters until January 1, 2025. This provision delays the similar provision in AB 1739 from 2022 to 2025. The bill further requires the SWRCB to exclude any portion of a basin in compliance with groundwater management requirements from probationary status. This provision narrows the similar provision in AB 1739 to only apply to the portion of the basin that is out of compliance.

The bill requires the SWRCB to include any element of a GSP or the entire plan in its interim plan if SWRCB finds it would help meet the sustainability goal. This provision revises the similar provision in AB 1739 to allow for the inclusion of local plans when developing interim plans for basins with probationary status.

A GSP has not yet been adopted for the Santa Paula Basin pursuant to SGMA and is not required until 2022.

SB 1262 (Pavley)—Water Supply Planning

In September 2016, Governor Brown signed SB 1262 (Pavley), which states that if a water supply for a proposed project includes groundwater from a basin that is not adjudicated and is designated as medium or high priority, the following additional information must be included in the WSA: whether DWR has identified the basin as being subject to critical conditions of overdraft; and if a GSA has adopted a (GSP) or approved an alternative plan under the SGMA, a copy of the GSP, or an alternative plan. For a basin that is not adjudicated and is designated by DWR as low or very low priority, the WSA must include information as to whether DWR has identified the basin as being overdrafted or projected that the basin will become overdrafted if present management conditions continue.

SB 1262 is not effective until January 1, 2017. However, as noted earlier, pursuant to SB 1262 and the amended Water Code Section 10910, the Santa Paula Basin is an adjudicated Basin of which the DWR has not indicated is in overdraft.¹⁸

1.5.4 United Water Conservation District

The United Water Conservation District (UWCD or District) is a public agency that encompasses nearly 213,000 acres of central and southern Ventura County. The District covers the downstream (Ventura County) portion of the valley of the Santa Clara River, as well as the Oxnard Plain. The District serves as a steward for managing the surface water and groundwater resources for all or portions of eight interconnected groundwater sub-basins. The developed areas of the District are a mix of agriculture and urban areas, with prime agricultural land supporting high-dollar crops such as avocados, berries, row crops, tomatoes, lemons, oranges, flowers, ornamental nursery stock, and sod. Approximately 370,000 people live within the District boundaries, including those living in the cities of Oxnard, Port Hueneme, Santa Paula, Fillmore, and eastern Ventura.

The District is authorized under its principal act (California Water Code Section 74000 et. Seq.) to exercise multiple powers; including the authority to conduct water resource investigations, acquire water rights, build facilities to store and recharge water, construct wells and pipelines for water deliveries, commence actions involving water rights and water use, prevent interference with or diminution of stream/river flows and their associated natural subterranean supply of water, and to acquire and operate recreational facilities in connection with dams, reservoirs, or other District works.

18 California's Groundwater Bulletin 118, Santa Clara River Valley Basin Santa Paula Subbasin, http://www.water.ca.gov/pubs/groundwater/bulletin_118/basindescriptions/4-4.04.pdf.

1.5.5 City of Santa Paula

Urban Water Management Plan

Section 10610 et seq. of the California Water Code, known as the Urban Water Management Planning Act, calls for creation and periodic update of UWMPs by all urban water suppliers and sets forth the requirements for such plans, including definition of relevant terms.

Under the definition given in Section 10617, an urban water supplier is an entity “providing water for municipal purposes either directly or indirectly to more than 3,000 customers or supplying more than 3,000 af of water annually.” Water for this development will be supplied from the City of Santa Paula’s existing water system which is supplied via groundwater wells throughout the City.

Accordingly, this WSA, in concert with the most recent Final 2016 UWMP prepared by the City, includes all necessary data and analyses required by California Water Code section 10910 et seq. and by Government Code section 66437.7 et seq.

In 2017, the City of Santa Paula completed an UWMP update based on the current and future uses within the City. This UWMP did not discuss the specific development and activities contemplated by the Santa Paula West Business Park, although it did discuss, in general terms, the nature and extent of the long-term water supply for the City for the West Area 2 and included an estimated 1,906,000 square feet of commercial/industrial/institutional uses on approximately 125 acres. The UWMP update is based on more current and future uses within the City. Much of this general discussion is cited and paraphrased in this WSA. The UWMP contains an analysis of the factors required by Government Code section 66437.7 (a)(2), and such factors apply to this WSA.

2.0 WATER DEMANDS

2.1 HISTORICAL AND CURRENT CONDITIONS

2.1.1 Existing Land Use

The local economy is composed of agricultural, industrial, and commercial interests. Residential development is currently the single largest land use. Santa Paula currently has a housing stock totaling approximately 9,100 units. Of these, 67 percent are single-family houses or condos; 26 percent are multifamily units; and 7 percent are mobile homes and trailers. Because a significant amount of its residential growth occurred prior to 1970, more than half of the housing stock in Santa Paula is more than 45 years old.¹⁹ Commercial development comprises less than 5 percent of the City's area, and industrial uses comprise approximately 6 percent.²⁰ City total water demands for the period of 1990 to 2014 ranged from a low of 4,376 af (1995) to 6,153 af (1990), with an average of 4,993 afy during that period.²¹ Projected water demands in 2020 are 4,609 af.²²

Future land uses are based on the City's General Plan. Within the City's existing limits and planning areas there is a potential for the following: 2,052 residential dwelling units (single- and multifamily); 131 acres of new commercial, industrial, and institutional development; and 797 acres of parks, recreation, golf courses, and open space, and 2 schools.²³

The City's General Plan anticipates approval of an amendment of the City's 1978 SOI to include six Expansion Areas, with a variety of land uses. Amending the SOI boundary and annexing the Expansion Areas to the City requires the authorization of the Local Agency Formation Commission (LAFCO); previous LAFCO hearings approved Adams Canyon, Fagan Canyon, East Area 1, East Area 2, and West Area 2 for inclusion into the City's SOI. Annexation of each Expansion Area will occur on a case-by-case basis after the completion of a Specific Plan and a market and fiscal evaluation; the City has recently completed annexation of two of these identified areas (East Area 1 [2010] and East Area 2 [2013]). In addition, each annexation area will require environmental review in accordance with CEQA. Ultimate build-out of residential units will be in accordance with the City's existing Growth Management Ordinance adopted in 1985. Type and amount of development that actually occurs will depend on many factors.

19 City of Santa Paula, *Final UWMP 2016 Update* (August 2017), 37.

20 City of Santa Paula, *General Plan, "Land Use Element"* (rev. January 22, 2013), City Council Resolution No. 6821.

21 City of Santa Paula, *Final UWMP 2016 Update* (August 2017), 41.

22 City of Santa Paula, *Final UWMP 2016 Update* (August 2017), 48, Table 3-3.

23 City of Santa Paula, *General Plan, "Land Use Element."* Rev 1/22/13, City Council Resolution No. 6821.

The proposed Project is located within the boundaries of the West Area 2 Expansion Area. The City's 2016 UWMP Update projects an estimated water demand of 87.7 afy for West Area 2.²⁴ At approximately 53.81 acres, the Santa Paula West Business Park Specific Plan would take up approximately 43 percent of the 125-acre West Area 2 planned expansion as designated in the General Plan.²⁵ As such, based on a pro rata share of the proposed development contemplated in the General Plan for West Area 2 and the corresponding water demand estimated in the 2016 UWMP Update, the proposed Project has a projected demand of 39.7 afy.

The Santa Paula West Business Park Specific Plan site is currently in agricultural use.²⁶ Water is currently supplied by a single on-site water well, which supplies water for both domestic and agricultural irrigation use.

2.1.2 Existing Water Supply and Demand

The existing land uses within the Specific Plan area includes approximately 54 acres of agricultural land, fallow agricultural land, and a small amount of industrial uses.

Water supply for irrigation on the Specific Plan area has been historically supplied from an on-site well that overlies the Santa Paula Basin. The existing well in the area (E11S) is owned and operated by McGaelic Group and Bender combined.

Approximately 49 acres of the Santa Paula West Specific Plan site is under cultivation for avocados, herbs, and a variety of row crops. Production records for the irrigation well for the period 2010 to 2014 are shown on **Table 3, Existing Well Pumping Records 2010 – 2014**. Water usage has been from one well but delivered to several parcels including McGaelic West (McGrath owners), Ilan Bender, and Jaime Santana; only the McGaelic West and Bender parcels are within the Project Site.²⁷ As shown on **Table 3**, during the last 5 years (2010 to 2014), the total water used on site has averaged 281.1 afy.

2.2 WATER CONSERVATION MEASURES

2.2.1 State of California Measures

The State of California Assembly Bill (AB) 1881 was enacted in 2009 to help California move forward as a leader in sustainable landscaping and water efficiency and to address the danger of our drought situation. Many residential and commercial properties currently use outdated irrigation technology; AB 1881 is a forward-thinking standard that prevents excessive or wasteful irrigation techniques by emphasizing the use and application of modern irrigation technology.²⁸

With current drought conditions persisting, emergency regulation amendments are proposed.

Mandatory Prohibitions on Water Wasting

“Water waste” can be defined as any excessive, unnecessary or unwarranted use of water, including, but not limited to, any use that causes unnecessary runoff beyond the boundaries of any property as served by its meter and any failure to repair as soon as reasonably possible any leak or rupture in any water pipes, faucets, valves, plumbing fixtures, or other water service appliances.

California Code of Regulations: Model Water Efficient Landscape Ordinance

The Model Water Efficient Landscape Ordinance was adopted in January 1, 2010, to, but not limited to, promote the conservation and efficient use of water and to prevent the waste of water; establish a

²⁸ Assembly Bill No. 1881, ch. 559 (January 23, 2006; approved, September 28, 2006; filed, September 28, 2006).

structure for planning, designing, installing, maintaining and managing water-efficient landscapes in new construction and rehabilitated projects; establish provisions for water management practices and water waste prevention for existing landscapes; and to encourage local agencies and water purveyors to use economic incentives that promote the efficient use of water, such as implementing a tiered rate structure.²⁹

California Green Building Standards Code (CALGreen)

The purpose of California Green Building Standards Code (“CALGreen”) is to improve public health, safety and general welfare by enhancing the design and construction of buildings through the use of building concepts having a reduced negative impact or positive environmental impact and encouraging sustainable construction practices in the following categories:

1. Planning and design
2. Energy efficiency
3. Water efficiency and conservation
4. Material conservation and resource efficiency
5. Environmental quality

The residential mandatory measures are provided in chapter 4 and the nonresidential ones in chapter 5 of the CALGreen Code.

In response to State of Emergency proclamations issued by Governor Brown in January and April of 2014, and the EO B-29-15 (issued April 1, 2015), California Department of Housing and Community Development (HCD) proposed emergency building standard regulations pertaining to the reduction of potable water use for exterior landscape irrigation for newly constructed residential buildings. HCD, in coordination with the California Building Standards Commission (CBSC),

DWR, the Division of the State Architect, and other stakeholders developed emergency regulations that amend the 2016 CALGreen Code.³⁰

CALGreen provides mandatory residential measures, such as stormwater drainage and retention systems, which are thought to prevent flooding of adjacent properties and prevent pollution from stormwater

29 California Code of Regulations, tit. 23, Waters, div. 2, Department of Water Resources, ch. 2.7, Model Water Efficient Landscape Ordinance.

30 California Department of Housing and Community Development, Finding of Emergency Regarding the 2013 California Green Building Standards Code (CALGreen), California Code of Regulations, tit. 24, pt. 11.

runoff by retaining soil on site or by providing filtering to restrict sedimentation from reaching stormwater drainage systems and receiving streams or rivers. To comply, the retention basin must be sized and shown on the site plan, and water has to be filtered and routed to a public drainage system. The new residential structure also must comply with local stormwater ordinances. The drainage system must also be shown on the site plan (swales, drain piping, retention areas, and groundwater recharge).

The code also requires a 20 percent reduction of indoor water use, and it utilizes both a prescriptive and performance method. The prescriptive method provides some technical features that must be followed:

- Showerheads \leq 2.0 gallons per minute (gpm) at 80 pounds per square inch (psi)
- Lavatory faucets \leq 0.5 gpm at 60 psi
- Kitchen faucets \leq 1.8 gpm at 60 psi
- Urinals \leq 0.5 gal/flush
- Water closets \leq 1.28 gallon/flush

CALGreen also specifies acceptable performance standards for plumbing fixtures with reduced water usage. Fixtures can be installed if they meet standards listed in the code.

Outdoor water usage is also regulated. CALGreen requires irrigation controls to be weather or soil moisture based and to automatically adjust irrigation in response to changes in plants' needs as weather conditions change, or have rain sensors or communication systems that account for local rainfall.

2.2.2 City of Santa Paula

Urban Water Management Plan (UWMP) Update

The City of Santa Paula has implemented water conservation measures to ensure that customers use water efficiently and that negligent use will have appropriate consequences. Water conservation policies are described in the Final 2016 UWMP Update.

Below is a partial list of current adopted water conservation policies from the Final 2016 UWMP Update:³¹

- Water waste prevention ordinances
- Metering
- Conservation pricing
- Public education and outreach
- Water loss control
- Conservation program coordination and staffing
- Other demand management measures that significantly impact water use

31 City of Santa Paula, *Final UWMP 2016 Update* (August 2017), 99.

The combined effect of these policies places responsibility for water conservation on both the developer and the City.

City Municipal Code, Ordinance 993 Section 52.038—Water Waste

“No person shall [un]lawfully or neglectfully waste water in any manner whatsoever. Continued wasting of water after mailing of [City] notice by registered mail to the customer of record at the mailing address of record by the [City] Director may result in discontinued water service.”³² This Code is a beneficial tool to curb misuse and waste of potable water within the City. The provisions of the Code can be utilized during periods of normal water supply and supply deficiency. Violation of this Code is subject to City penalties.

City Municipal Code, Ordinance 1223, Chapter 59—Landscape Water Conservation Standards

In accordance with Government Code 65565(c) for the purpose of complying with California law and promoting water conservation the City maintains Ordinance 1223, Landscape Water Conservation Standards, to be utilized in conjunction with the City of Santa Paula land Development Provisions for Landscaping and the Guidelines for Implementation of Water Efficient Landscape.³³ Compliance with the guidelines and Landscape Water conservation Standards is mandatory for all new development projects that are subject to discretionary review by the City of Santa Paula.

Water Shortage Contingency Plan

The City’s Water Shortage Contingency Plan was originally prepared to comply with AB 11x (1991). The bill required every urban water supplier to file a plan due to the worsening 1986-1992 drought.

The City has several options for meeting future water demands, including increased deliveries of local groundwater, increased deliveries of imported water, evaluating recycled water, and supporting water demand management programs. This has allowed the City, to date, to meet demands in spite of the prior drought conditions. Water shortages can be triggered by a hydrologic limitation in supply (i.e., a prolonged period of below-normal precipitation and runoff), limitations or failure of supply and treatment infrastructure, or both. Hydrologic or drought limitations tend to develop and abate more slowly, whereas infrastructure failure tends to happen quickly and relatively unpredictably.

Drought periods going back to 1929 have caused pumping levels to decrease, however there never has been a necessity to implement mandatory restrictions of water use. More efficient use of water was

32 City of Santa Paula, Santa Paula Municipal Code, Ordinance 993, sec. 52.038—Water Waste.

33 City of Santa Paula, Santa Paula Municipal Code, Ordinance 1223, ch. 59—Landscape Water Conservation Standards Ordinance (December 2009).

encouraged during the 1976 to 1977 period. An even greater awareness of water conservation occurred during the 1987 to 1992 drought. This increased awareness resulted in more efficient use of water.

Additional supply reductions could be caused by regional power outage, terrorist activity, earthquake, tsunami or other significant meteorological event. The City prepared an Emergency Response Plan (2004) which provides details of emergency responses for numerous significant events that may affect the City's water system.

Reductions in Santa Paula Basin Production Required by the Stipulated Judgment

According to the Judgment if it is found that the safe yield of the Santa Paula Basin is less than the total pumping allocations, then the pumping allocations shall be reduced. The Judgment specified that reductions in pumping will be required in the order of priority specified in **Table 4, Water Shortage Contingency—Rationing Stages to Address Water Supply Shortages**.

Table 4
Water Shortage Contingency—Rationing Stages to Address Water Supply Shortages

Stage	Water Supply Conditions
1	All uses in excess of the pumping allocations will be cut back to the approved allocations
2	Cumulative pumping allocation of the Santa Paula Basin Pumpers Association (SPBPA) will be reduced by 500 af annually. This reduction will reflect reasonable conservation that can be achieved. The SPBPA will determine how a reduction in its cumulative allocation will be implemented
3	Pumping allocation of the City of San Buenaventura shall be reduced to 1,141 af per year. This allocation reflects the City of San Buenaventura's historical maximum annual production prior to the Judgment
4	The remaining pumping allocations of all parties to the Judgment will be further reduced simultaneously. The SPBPA will reduce their total annual allocations by 2,000 af. The City of San Buenaventura will reduce their total annual allocations by 500 AF
5	The City of San Buenaventura will cease pumping from the Santa Paula Basin
6	The remaining pumping allocations of the SPBPA will be reduced by the amount required to bring production into balance with the revised safe yield of the Santa Paula Basin

Source: City of Santa Paula, 2016 UWMP Update (August 2017), 17–18.

Proposed Water Demand Reduction Program

The City is establishing a water demand reduction program for worst-case planning purposes consisting of the implementation of a five-stage water demand reduction program. Stage 1 would impose a voluntary 10 percent water demand reduction goal, Stage 2 would impose a 20 percent mandatory reduction goal, and Stage 3 would impose a 30 percent mandatory reduction goal, Stage 4 would impose a 40 percent mandatory reduction goal, and Stage 5 would impose a 50 percent mandatory reduction

goal. Each stage would be implemented as needed based on actual or anticipated supply reductions. The City's Public Works Director would monitor water supplies and demands on a daily basis, which would allow the City to determine the effects of reductions on water production within the system. If evidence of a shortage exists, the Public Works Director would determine the extent of the severity and recommend the applicable stage. The Public Works Director would notify the City Council of the water supply situation, and the Council would be responsible for ratifying the proposed measures.

Proposed specific water demand reduction measures and triggering mechanisms for each stage are listed in the Final 2016 UWMP Update and presented below.³⁴

Stage 1: 10 Percent Voluntary Reduction—Supply Watch

Stage 1 would be implemented when 10 percent reduction in water production capacity (or supplies) occurs or is anticipated. This reduction could be due to fire, earthquake, system failures, water quality contamination, or other event. All restrictions during Stage 1 are voluntary. The goal for Stage 1 is a 10 percent reduction in water demand. Measures to be implemented during this stage include but are not limited to the following:

- City to communicate to the customers through press releases, brochures, mailings, and/or water bills the need to voluntarily conserve water and the many ways possible to conserve without affecting their overall lifestyles.
- Water customers requested to voluntarily limit the irrigation of landscaped areas.
- Water customers requested to voluntary limit nonessential water use. Nonessential water used defined as:
 - Use of water to wash any motor vehicle, motorbike, airplane, or other vehicle.
 - Use of water to wash down sidewalks, walkways, driveways, parking lots, tennis courts, or other hard-surfaced areas.
 - Use of water to wash down buildings or structures for purposes other than immediate fire protection.
 - Flushing gutters or permitting water to run or accumulate in any gutter or street.
 - Use of water to fill, refill, or add to any outdoor or indoor swimming pools, or Jacuzzi-type pools.
 - Use of water in a fountain or pond for aesthetic or scenic purposes except where necessary to support aquatic life.
 - Failure to repair a controllable leak within a reasonable period after having been given notice directing the repair of such leak.

34 City of Santa Paula, *Final UWMP 2016 Update* (August 2017), 93.

Stage 2: 20 Percent Mandatory Reduction—Supply Caution

Stage 2 would be implemented when up to a 20 percent reduction in water production capacity occurs or is anticipated. This reduction could be due to fire, earthquake, system failures, water quality contamination, or other event. All restrictions in Stage 2 are mandatory. The goal for Stage 2 is 20 percent reduction in City customer water demand. Measures to be implemented during this stage include but are not limited to the following:

- Continue to maintain Stage 1 measures; however, they become mandatory in Stage 2.
- City to mail information to water customers regarding the importance of significant water use reductions.
- Assess a monetary fee to repeat offenders of water demand reduction measures.
- Prohibit watering landscape between 8:00 AM to 6:00 PM.
- All restaurants are prohibited from serving water to patrons except upon request of the patron.
- Perform an evaluation of Stage 1 water conservation measures and implement those not completed. Public Works Director to report to the City Council as appropriate.
- Appoint a Water Conservation Coordinator. This can be an individual already working for the City with related duties.

Stage 3: 30 Percent Mandatory Reduction—Supply Warning

Stage 3 would be implemented when up to a 30 percent reduction in water production capacity occurs or is anticipated. This reduction could be due to fire, earthquake, system failures, water quality contamination, or other event. The goal for this stage is 30 percent reduction in City customer water demand. Measures to be implemented during this stage include but are not limited to the following:

- Continue to maintain measures included in Stages 1 and 2.
- Landscape irrigation by means of hand-held hoses, hand-held buckets, soaker hoses, drip irrigation, hose-end sprinklers, or permanently installed automatic sprinkler systems are limited to twice per week. Landscape irrigation by grey water and recycled water authorized.
- Perform an evaluation of Stage 2 water conservation measures and implement those not completed. Public Works Director to report to the City Council as appropriate.

Stage 4: 40 Percent Mandatory Reduction—Supply Danger

Stage 4 would be implemented when up to a 40 percent reduction in water production capacity occurs or is anticipated. This reduction could be due to fire, earthquake, system failures, water quality contamination, or another event. All restrictions in Stage 4 are mandatory. The goal for Stage 4 is 40 percent reduction in City customer water demand. Measures to be implemented during this stage include but are not limited to the following:

- Continue to maintain measures included in Stages 1 to 3.
- Landscape irrigation by means of hand-held hoses, hand-held buckets, soaker hoses, drip irrigation, hose-end sprinklers, or permanently installed automatic sprinkler systems are limited to once per week. Landscape irrigation by grey water and recycled water authorized.
- Perform an evaluation of Stage 3 water conservation measures and implement those not completed. Public Works Director to report to the City Council as appropriate.

Stage 5: 50 Percent Mandatory Reduction—Supply Critical

Stage 5 would be implemented when up to a 50 percent reduction in water production capacity occurs or is anticipated. This reduction could be due to fire, earthquake, system failures, water quality contamination, or another event. All restrictions in Stage 5 are mandatory. The goal for Stage 5 is 50 percent reduction in City customer water demand. Measures to be implemented during this stage include but are not limited to the following:

- Continue to maintain measures included in Stages 1 to 4.
- Landscape irrigation shall be prohibited except by grey water and recycled water.
- Perform an evaluation of Stage 4 water conservation measures and implement those not completed. Public Works Director to report to the City Council as appropriate.
- Consider implementing a customer water allocation based on a yearly average for metered services. For those users who exceed their allocation, impose a 25 percent fee for the excess water demand (based on prior month's usage). Install a flow restrictor on meter for repeat offenders of excessive use.
- All water use not required for health and safety is prohibited.

3.0 WATER SUPPLY ASSESSMENT

A WSA is required to identify and describe the water supply sources of the PWS that will serve the project.

State Water Code Section 10910(d) requires a WSA to include identification of any existing SWP water, water rights, or water service contracts relevant to the identified water supply for the proposed Project. A complete discussion of SWP source and Table A allocations is provided, as well as a description of the quantities of water received in prior years by the PWS is also to be provided.³⁵

3.1 IDENTIFICATION OF WATER SOURCES

3.1.1 Primary Water Source

The City of Santa Paula will provide water service to the proposed Project.³⁶ The City currently has secured water rights from two sources: groundwater allocation from the Santa Paula Basin and a surface water wheeling agreement with the Canyon Irrigation Company. Surface water from Santa Paula Creek was a major source of potable water supply for the City's service area until wells were drilled into the Santa Paula Basin to augment the supply from Santa Paula Creek. Currently the Santa Paula Basin is the City's sole source of water supply.

3.1.2 Analysis of Water Supply

Groundwater

As previously stated, the City of Santa Paula has been dependent primarily on groundwater as a source of domestic water supply. Groundwater is also used to supply water for crop irrigation and commercial and industrial uses within the City.

Water Code Section 10910 (f) requires additional information when a groundwater basin is cited as the water supply source for a project including a description of the basin, the rights of the PWS to use the basin, the overdraft status of the basin, any past or planned overdraft mitigation efforts, historical use of the basin by the PWS, projected use of the basin by the project, and a sufficiency analysis of the basin.

Description of the Aquifer

The Santa Paula Basin is a subbasin of the larger Santa Clara River Valley Groundwater Basin. Other subbasins within the Santa Clara River Valley Groundwater Basin include the Fillmore, Piru, Mound, and Oxnard Subbasins. Each of the five subbasins is an alluvial basin recharged, in part, by the Santa Clara

³⁵ California Water Code, sec. 10910–10915, 10910(b).

³⁶ City of Santa Paula, *Santa Paula West Business Park Specific Plan* (amended October 2016).

River.³⁷ For the sake of simplicity, and because the subbasins are subject to varying forms of management, this WSA refers to the Santa Paula Basin as basin rather than subbasin.

The Santa Paula Basin underlies the City of Santa Paula and unincorporated areas to the southwest of the City within the Santa Clara River Valley. The basin is bounded by the impervious rocks of the Topatopa Mountains to the north, impervious rocks of Oak Ridge and South Mountain, the Oak Ridge fault, and Saticoy fault on the south.³⁸ The eastern edge of the basin is marked by a bedrock constriction, with the boundary placed at the position of maximum rising water. The western boundary separates the Santa Paula basin from the Mound and Oxnard Subbasins, with the western boundary placed where there is a distinct change in the slope of the water table. Ground surface elevations range from 140 feet above sea level in the west to about 1,000 feet above sea level along the Santa Paula Creek drainage. The Santa Clara River and Santa Paula Creek drain the valley westward toward the Pacific Ocean. Average annual precipitation ranges from 14 to 18 inches.

The principal fresh water-bearing strata of the Santa Paula Basin are the Pleistocene San Pedro Formation, Pleistocene river deposits of the ancient Santa Clara River, alluvial fan deposits shed from the uplifted mountain blocks, and recent river and stream sediments deposited locally along the Santa Clara River and its tributaries. These water-bearing sediments are underlain by relatively impermeable Pliocene and older units. The sediments of the basin have been warped into a syncline that is oriented in a northeast-southwest direction along the center of the basin. To the east, the Santa Paula basin is in hydraulic connection with the Fillmore basin, its' primary source of recharge. To the south, the Oak Ridge fault forms a partial barrier to groundwater movement. On the north, the portion of the aquifer represented by the San Pedro Formation is exposed in an outcrop along the Sulphur Mountain foothills.

The western boundary of the Santa Paula Basin is more complex, with local uplift, artesian conditions, and faults mapped by some investigators. Although there is general agreement that there is hydraulic connection between Santa Paula Basin, the Oxnard Forebay Basin, and the Mound Basin, the degree of connection is uncertain. The Santa Paula Basin has a storage capacity of approximately 754,000 af. The basin is estimated to be approximately 90 percent full, with about 675,000 af of groundwater in storage.³⁹

37 California Resources Agency, DWR, *California's Groundwater*, Bulletin 118 Update 2003 (October 2003).

38 California Resources Agency, DWR, *California's Groundwater*, Bulletin 118 Update 2003 (October 2003).

39 California Resources Agency, DWR, *California's Groundwater*, Bulletin 118, Santa Clara River Valley Basin: Santa Paula Subbasin (February 2004).

As reported by the Ventura County Watershed Protection District, the 2016 total precipitation for Santa Paula was 9.88 inches. The accumulated total rainfall to date for 2017 is 25.66, approximately 142.2 percent of normal (18.05 inches).⁴⁰

The Santa Paula Basin is recharged by percolation of surface flow from the Santa Clara River, Santa Paula Creek, and other minor tributary streams, as well as subsurface flow from the Fillmore Basin.⁴¹ Some of the surface flow in the Santa Clara River originates as release from Lake Piru and contains natural runoff of precipitation and imported SWP water, it is important to note that there has not been a release from Lake Piru in the last year due to drought.⁴² Control of the quagga mussel is another limiting factor for water release.⁴³ Percolation of precipitation and unused irrigation waters provide additional recharge. Groundwater in the Santa Paula Basin generally flows toward the southwest.⁴⁴

Groundwater Extraction

While there have been periodic declines in water levels within the Santa Paula Basin, it is not considered to be in a state of overdraft. The “assumed initial yield” of the basin is 33,500 afy. Under the terms of the Judgment, a 7-year study period (1996 to 2003) formed the basis for determining actual safe yield. After 7 years, water use data was analyzed to refine the assumed initial yield of 33,500 afy. United Water Conservation District prepared a report on the status of the Santa Paula Basin.⁴⁵ The UWCD Report concluded that the average groundwater production during the period 1983 to 1995 was 26,000 af. According to the Report, no overdraft was observed at the documented production rates over the period 1983 to 1995. The Report also identified that during the period 1997 to 2003 parties to the Judgment had cumulatively produced 42,111 af less than their combined total allocation for this period. Yield of the Santa Paula Groundwater Basin appeared to be no less than 26,000 afy.⁴⁶ Approximately 12,000 acres or agricultural land is irrigated by groundwater in the Santa Paula Basin. Groundwater extractions are reported on the semiannual groundwater production statements filed with UWCD’s Finance Department by individual pumpers. These production statements constitute all known pumping from the Santa Paula

basin. In calendar year 2011, 24,202 af of groundwater was extracted from the Santa Paula basin. A summary of the 2011 extractions is shown in **Table 5, Summary of Recent Groundwater Extractions**. The 2014 reported groundwater extractions of 27,437 af were greater than the average for the period of record (1980 to 2014) average of 25,771 af.⁴⁷ In addition to this information, the Urban Water Management Plan provides supplemental groundwater pumping data for the City of Santa Paula as a whole, including projected pumping figures ongoing until 2040.

Table 5
Summary of Recent Groundwater Extractions

Pumper	2013 Extractions (af)	2014 Extractions (af)
City of San Buenaventura	901	791
Santa Paula Basin Pumpers Association (SPBPA) Pumpers with Individual Party Allocations (adjusted extractions)	25,530	26,610
SPBPA Pumpers with Individual Party Allocations (reported extractions)	25,554	26,613
Nonstipulated Parties	14	17
De Minimis Pumpers	16	16
Total Production		
Adjusted by SPBPA	26,461	27,434
Reported to UWCD)	26,485	27,437

Source: United Water Conservation District, Combined 2013 and 2014 Santa Paula Basin Annual Report, professional paper 2016-01, prepared by Santa Paula Basin Technical Advisory Committee (January 2016).

Note: af = acre-feet.

Long-term, gradual declines in water levels have been observed in many parts of the basin. These declines have not been rapid, and are relatively small; however, they may be indicative of changing hydrologic conditions in the basin that warrant further monitoring and, if the trend persists, the development of alternative basin management strategies.

Water production for the period 2005 to 2015 is presented in **Table 6, City of Santa Paula Water Production**. According to City Water Division staff, total water produced in 2010 was 4,455 af, and in 2015 was 3,907 af. City water production in 2005 was 5,047 af (592 af greater when compared to 2010, and 1,140 af greater when compared to 2015). The highest annual water demand for the period 2005 to 2015 was recorded in 2007 with 5,347 af produced. Groundwater production during 2011 was less than the average in recent years, and precipitation was above average. This resulted in water level rises or stable water levels from 2010 to 2011.

⁴⁷ UWCD, *Combined 2013 and 2014 Santa Paula Basin Annual Report* (January 2016).

Note: afy = acre-feet per year.

The City's current groundwater supply includes production from five active wells. Domestic water is pumped from Well Nos. 1-B, 11, 12, 13, and 14. and **Table 7, City of Santa Paula Groundwater Resources 2015**, summarizes the City's groundwater resources by well, including current status, well capacity, and 2015 production. The City no longer operates Wells Nos. 2, 8, and 9 due to a history of elevated nitrate levels in water extracted from these sources. These wells were sold to an agricultural enterprise.⁴⁸

Table 7
City of Santa Paula Groundwater Resources 2015

Well No.	Status	Capacity (gpm)	2015 Production (af)
1-B	Active	812	104

Notes: gpm = gallons per minute; af = acre-feet.

⁴⁸ City of Santa Paula, Final UWMP 2016 Update (August 2017), 66.

Pumping Allocations

The Judgment governs groundwater production on a 7-year rolling average, which allows parties to produce more or less allocation in any particular year so long as their rolling 7-year average does not exceed their allocation. The average is a rolling average, in 2014 the average extraction amount will be based on the period from 2008 to 2014.

The total combined pumping allocations of the SPBPA (party and nonparty) and the City of San Buenaventura (Ventura) are now at 30,771.6 afy. Amendments to the Judgment in 2010 provided the Santa Paula Basin Pumpers Association with an additional 280.2 af of allocation, which was granted to pumpers that were not previously parties to or identified within the Judgment. The current allocations were calculated and granted using the lesser of the following two options: (1) the average production reported to UWCD from calendar years 2002 through 2008; or (2) the average production reported to UWCD prior to the Judgment (1989 to 1995). Additionally, a total of 40.7 af of SPBPA's allocation is held in "reserve" by the SPBPA for nonparty pumpers have declined to stipulate and become parties to the Judgment. In addition, the City of Ventura has acquired 225.8 af of prior SPBPA allocation through water allocation transfers to the City.⁴⁹

The SPBPA's calendar year 2013 and 2014 allocations were 27,545.8 afy (excluding nonparties) distributed among its members with a 7-year average surplus of 2,123.8 af from pumping below the allocation. The City of San Ventura's 2013 and 2014 allocations were 3,000 af plus 225.8 af of prior Santa Paula Basin Pumpers Association allocation with a 7-year average surplus of 2,293.6 af from pumping below its allocation.⁵⁰

The Judgment also allows for de minimis production by landowners that are not allocated an Individual Party Allocation, which allows these landowners to produce groundwater for uses on their overlying property so long as such use does not exceed 5 aft in any particular year. In calendar years 2013 and 2014, there were five de minimis producers.⁵¹

Historical Groundwater Levels

Historically, water level trends in the Santa Paula basin were summarized through the use of a Groundwater Level Index. The index includes nine key wells in the basin that were selected for their relatively long record and geographic distribution across the basin. The following observations were made of the Groundwater Level Index graph:

49 UWCD, *Combined 2013 and 2014 Santa Paula Basin Annual Report* (January 2016).

50 UWCD, *Combined 2013 and 2014 Santa Paula Basin Annual Report* (January 2016).

51 UWCD, *Combined 2013 and 2014 Santa Paula Basin Annual Report* (January 2016).

- 1983 to drought period of 1990 and 1991: declining index that directly mimics the declining cumulative departure from average precipitation trend;
- 1991 to 1998: characterized as a wetter period than previous with an increasing index and cumulative departure from average precipitation;
- 1998 to 2011: a net positive cumulative departure from average precipitation during this period with partial rebounds in the groundwater level index during particularly wet water years 2005 and 2011;
- 2011 to 2014: a steep decline in groundwater level index, corresponding to below-average precipitation since water year 2012, including the driest back-to-back water years 2013 and 2014 recorded since 1898 and 1899.

Since 2005, there have been 3 above-average precipitation years, including 2011, and 5 below-average precipitation years. In general, the trend in the Groundwater Level Index tends to follow the trend in the cumulative departure from average precipitation curve, that is, trending down during drier-than-average periods and trending up during wetter-than-average periods.⁵² As an update, since the year 2012, rainfall has declined to drought conditions, then increased again in 2015. Total annual precipitation data for the Santa Paula area from 2010 to 2016 is presented in **Table 8, Annual Precipitation Totals: 2010–2016**.

Table 8

Historical Groundwater Extraction

The historical groundwater extractions for the Santa Paula basin are shown in **Table 9, Historical Santa Paula Basin Groundwater Extractions**. The extractions vary from a high of 33,453 af in 1990 during the peak of the last drought to a low of 16,710 af during the very wet year of 1983. The extractions during

⁵² UWCD, *Combined 2013 and 2014 Santa Paula Basin Annual Report* (January 2016).

2010 (a wet year) were reportedly 4,322 aft below what was extracted in 2014, which received about one-third less water during the rainfall year.

Source: United Water Conservation District, Combined 2013 and 2014 Santa Paula Basin Annual Report, professional paper 2016-01, prepared by the Santa Paula Basin Technical Advisory Committee (January 2016).

While there have been periodic declines in water levels within the Santa Paula Basin, members of the SPBPA agree that the Santa Paula Basin is not in a state of overdraft. The parties agreed that the “assumed initial yield” of the basin is 33,500 afy. Under the terms of the Judgment, a 7-year study period (1996 to 2003) formed the basis for determining actual safe yield. After 7 years, water use data was analyzed to refine the assumed initial yield of 33,500 afy. United Water Conservation District prepared a report⁵³ on the status of the Santa Paula Basin. The UWCD report concluded that the average groundwater production during the period 1983 to 1995 was 26,000 af. According to the Report, no overdraft was observed at the documented production rates during the period 1983 to 1995. The Report also identified that during the period 1997 to 2003, parties to the Judgment had cumulatively produced 42,111 af less than their combined total allocation for this period. Yield of the Santa Paula Groundwater Basin appeared to be no

53 UWCD, *Santa Paula Basin 2003 Annual Report*, <https://www.unitedwater.org/images/stories/Resource-Conservation/GW-Management/Groundwater-Hearing/Exhibits/U62%20-%20Santa%20Paula%20Basin%202003%20Annual%20Report.pdf> (November 2004).

less than 26,000 afy.⁵⁴ However, the Report did not recommend a change in the basin’s yield. The UWCD is conducting an analysis to update the current safe yield of the basin with completion anticipated in 2016.⁵⁵

Aquifer Adjudication

Disagreement over the issue of safe yield of groundwater between the UWCD and other parties using water from the Santa Paula Basin, including the City of Santa Paula and the City of San Buenaventura (Ventura), led to the adjudication of groundwater rights within the Santa Paula Basin in 1996. A stipulated judgment was agreed to by the parties, and after review and approval by the Ventura County Superior Court, was entered as a final judgment (“Judgment”) to adjudicate groundwater rights within the basin. In summary, the Judgment adjudicates groundwater rights, regulates individual and collective pumping, provides for basin management through a Technical Advisory Committee (TAC), and reserves jurisdiction in the Superior Court to resolve future disputes and provide for supplementary orders as necessary.⁵⁶

The Judgment allocates the use of groundwater in the Santa Paula Basin between the City of Ventura and the SPBPA, which is a consortium of water users in the Santa Paula area, including the City and farming interests. UWCD is also a party to the Judgment. Although UWCD does not produce water from the Santa Paula Basin, the basin is located within its boundaries, and UWCD is authorized to engage in groundwater management and replenishment activities and to act to protect water supplies that are of common benefit to the lands and residents within UWCD.⁵⁷

Currently, the SPBPA possesses a collective groundwater right allocation of 27,551 afy that it holds in trust for its membership. The Judgment further subdivides the collective 27,515 afy allocation as sub-allocations to each of the SPBPA members and a few nonparties.⁵⁸ The allocations and sub-allocations for 2016 are summarized in **Table 10, Santa Paula Basin Water Allocations (2016)**.

Pursuant to the terms of the Judgment and recent acquisitions, the City of Santa Paula has a sub-allocation of 5,560 afy available for urban uses.⁵⁹ However, the City transferred 673 afy to Canyon Irrigation Company in January 1998. This amount could be adjusted if the terms of the Judgment are modified, or if

Note: afy = acre-feet per year.

^a City of Santa Paula, Final UWMP 2016 Update (August 2017), Appendix D, Table 6-9 Retail: Water Supplies—Projected.

^b Includes Bender and McGaelic Farms.

The City of Ventura has an allocation to pump on average 3,261 afy under a Class II Emergency. A long-term drought situation affecting surface water supplies would be considered a Class II Emergency. In addition, the Judgment also provides for an unallocated reserve of 2,688 afy.⁶¹

Water on the Project Site used for irrigation has been historically supplied from on-site wells. All wells are listed in the Judgment as being within the Santa Paula Basin. Withdrawals from all of the wells have been accounted for under the Santa Paula Basin Judgment. Currently, the members of the SPBPA have a cumulative allocation to pump on average 27,515 afy.⁶² The Judgment sets forth an “assumed initial yield” of the basin at 33,500 afy, subject to modification if credible technical information demonstrates a need for a change. The Judgment also set forth a 7-year study period to evaluate the appropriateness of the assumed initial basin yield of 33,500 afy, which began on January 1, 1996. The average is a rolling average; thus, for 2011, the average extraction amount was based on the period from 2005 to 2011. After the 7-

62 City of Santa Paula, Final UWMP 2016 Update (August 2017), 18.

year study period, UWCD and the other members of the TAC collaborated to produce a study of the basin's groundwater conditions and the implications for the initial 33,500 afy yield allocation.⁶³

Groundwater production during 2014 was greater than the average in recent years, and precipitation was less than average. Production has remained less than the pumping allocations.⁶⁴ The observed decline in groundwater levels has been a matter of some concern, but the decline has not been abrupt and further monitoring and research is in process to determine the cause of the decline and the most appropriate and cost-effective remedial action should this trend continue without stabilizing. More in-depth monitoring and research is underway to correlate annual basin recharge, discharge, and water level changes used to understand and determine the basin status.

UWCD has historical groundwater elevation data for 150 wells, 90 of which extensive records exist.⁶⁵ The other wells either have been destroyed or are no longer being monitored. Recorded groundwater level highs in 2009 and 2010 are below the recorded groundwater level highs seen in 1998. From 1998 to 2009, 47 wells show groundwater level declines, 1 well shows a groundwater level rise, 1 well shows no change in groundwater level, and 26 wells have no groundwater level measurements in 1998 or 2009. From 1998 to 2010, 49 wells show groundwater level declines, 1 well shows a groundwater level rise, 2 wells show no change in groundwater levels, and 23 wells have no groundwater level measurements in 1998 or 2010.

Since 1998, the basin has experienced only two significant wet years: 2001 at 26.54 inches of precipitation, and 2005 at 40.54 inches of precipitation.⁶⁶ The next highest precipitation years were in 2011 at 23.80, 2003 at 19.94 inches, and at 2010 at 19.33 inches. The groundwater level declines in the basin since 1998 are in response to this relatively dry period. If the basin is operating within a yield, groundwater levels should recover to 1998 levels or at least to 2005 levels with the onset of a wet period.⁶⁷

The estimated subsurface outflow was reported by DWR in Bulletin 118 to be 7,200 afy. Average annual extraction was estimated to be 21,612 afy in Bulletin 118.⁶⁸ Based on the most recent data from 2003, the average annual pumping rate of approximately 26,000 afy for the period from 1983 through 1995 is considered sustainable.⁶⁹ Furthermore, it is the opinion of the Santa Paula Technical Advisory Committee that the yield of the basin is greater than the average annual production of 26,000 af. Fluctuations in

69 Santa Paula Basins Expert Group, *Investigation of Santa Paula Basin Yield*, prepared for Santa Paula Basin Technical Advisory Committee (July 2003).

groundwater levels correlate with precipitation trends, and long-term observations suggest that the basin was not in a state of overdraft.⁷⁰ However, the TAC recommended that the yield remain at 33,500 afy.⁷¹

Water Code section 10631 requires that this WSA (a) identify whether the DWR has determined, in the most recent official department bulletin, whether the Santa Paula Basin is presently in a state of overdraft or at risk of becoming overdrafted under current conditions; and (b) provide an analysis of the sufficiency of the basin's groundwater supply to meet the projected water demands of the of the proposed Project. DWR's most recent assessment of conditions in the Santa Paula Basin was issued as part of DWR's Bulletin 118, Update 2003, which does not state that any portion of the Santa Paula Basin is presently, or was previously, in a state of overdraft.⁷² Bulletin 118 does, however, report as follows:

Hydrographs from the Santa Paula Subbasin show a range of up to 55 feet in water level elevation since 1975. The hydrographs show an annual cyclic rise and fall of water level of about 20 feet with longer-term variations apparently following precipitation cycles. The subbasin was at a low level in 1991 and 1992, then recovered by 1994 and has remained stable since then.

A basin yield study by experts for the City of Ventura, SPBPA, and UWCD suggests that the safe yield of the basin is probably near the historic pumping amount.⁷³

The 2013 and 2014 Combined Annual Report for the Santa Paula Basin concluded that the majority of the wells monitored in the Santa Paula basin have experienced a gradual groundwater level decline; however, the changes vary from well to well and period to period with some wells showing a slight increase in groundwater levels, but the majority of wells showing a modest decline in water levels."⁷⁴

As the forgoing discussion illustrates the Santa Paula Basin is comprehensively managed by the TAC, UWCD, and the reserved jurisdiction of the Court, as provided in the Judgment. The basin's water tables have stabilized and appear to be sufficient to support the allocation of groundwater rights set forth within the Judgment. Moreover, groundwater production rights are defined and limited as a collective whole and in relation to each of SPBPA's individual members. This confinement and definition of the groundwater rights existing within the Santa Paula Basin provides additional certainty for the long-term reliability of the groundwater supply from the basin.

Groundwater Allocation Transfers from Developed Properties

In accordance with City Municipal Code section 52.021 (Water Resource In-Lieu Fee Ordinance No. 1058), landowners or developers are required to transfer their groundwater rights to the City as a condition of project approval. The intent of the Ordinance is to ensure that new urban land users provide sufficient water resources for their needs without taxing existing users. If the associated water rights are not sufficient to serve the proposed development's anticipated water use (as determined by the City), or if the water rights are held by another entity who cannot or will not dedicate those rights to the City, the developer must purchase additional water rights and dedicate them to the City or pay a water resource in-lieu fee to the City. This ordinance applies to water rights within City limits as well as parcels outside City limits who must receive service from the City Water Enterprise.

Table 11 Existing and Potential City Water Resources and Demand 2016 UWMP contains a summary of existing and potential water resources for the City. The City identified 1,925 afy of potential groundwater allocations that could be transferred to the City from overlying landowners within the City General Plan boundary. One property includes a reserve of 110 afy for agricultural uses. Thus, the maximum potential net groundwater transfer is 1,815 afy (further reduced to 1,738 afy in 2017 due to recent transfers). These transfers will occur in phases during the next 20 years as development occurs within the City. Transfers of allocations will need to be reported to the Technical Advisory Committee in accordance with the Judgment. The SPBPA will then transfer the applicable number of memberships (allocations) when transfers are between association members; a membership is equal to 1 afy of groundwater allocation.⁷⁵

* Projected data.

** Data taken from 2020 data.

*** 2015 data taken from Final 2010 UWMP (June 2011).

Notes:

All values rounded to the nearest 1 acre-foot (af).

Santa Paula West Area Business Park Specific Plan would start construction in 2017 and be completed by 2027. Conservatively assumed full build-out Project Demand numbers in 2017.

afy = acre-feet per year.

^a The City's current allocation is 5,488 afy (California, 2011; Frank B. and Associates, 2016), updated in the 2016 UWMP to 5,560 afy 2016 UWMP Update (August 2017), Appendix D, Table 6-9 Retail: Water Supplies - Projected

^b The City currently wheels the 500 afy of surface water from Santa Paula Creek to Farmers Irrigation Company, which uses the surface water in lieu of pumped groundwater, and the City gains 500 afy groundwater pumping credits in the Santa Paula Basin.

^c The City anticipates receiving 1,816 afy of groundwater allocation transfers via agricultural land development by 2040. For planning purposes, the 1,816 afy is distributed equally from 2020 to 2040. Note that the method for dividing up groundwater allocations through the years was done differently in the 2016 Draft UWMP than in the 2010 Final UWMP, where allocation transfers were achieved during four equal 5-year periods (approximately 454 afy per 5-year period).

^d The City anticipates purchasing 497 afy of additional groundwater allocations by 2040. For planning purposes, the 497 afy is distributed equally from 2020 to 2040.

^e For planning purposes, the City does not anticipate receiving SWP water during the period 2020-2040.

^f The City anticipates initiating a recycled water program by 2020. Estimate includes new community landscaped areas with irrigation, a potential golf course, and potential agricultural irrigation. It is anticipated that approximately 2,000 afy could be developed by 2040. For planning purposes, the 2,000 afy is distributed equally from 2020 to 2040.

^g Existing demand is from 2015 data and is made up of 2,106 af from single-family residential, 868 af, from multifamily residential, 493 af from commercial/institutional, 48 af from industrial, 49 af from landscape irrigation, 22 af from other, 44 af from sales to Middleroad Mutual Water Company, and 277 af from estimate losses.

^h City anticipates 2,808 afy of new potential residential, commercial institutional, industrial, and landscape development by 2040 for build-out of potential projects.

ⁱ Estimated at 5 percent of total new demands.

The 2016 UWMP Update anticipates that the City will acquire through allocation transfers 448 afy by 2020, 895 afy by 2025, 1,343 afy by 2030, 1,790 by 2035, and 2,235 afy by 2040.⁷⁶

Implementation of these water supply programs is anticipated to provide the City with sufficient water supplies to meet future water demand. As shown in **Table 11**, the potential water supplies available to the City exceed the estimated water demand at City build-out conditions.

Purchased Groundwater Allocations

In 2005, it was determined that there were 497 afy of potentially available groundwater allocations held by others within the Santa Paula Groundwater Basin boundary that were not being utilized). The City has the option to independently pursue the acquisition of groundwater allocations at any time in the future. The 2016 UWMP Update estimated that the City may purchase additional allocations of 348 afy by 2020, 695 afy by 2025, 1,043 afy by 2030, 1,390 by 2035, and 1,738 afy by 2040.⁷⁷

State Water Project Water

The SWP's California Aqueduct is owned and operated by DWR. Ventura County contracted for 20,000 afy of SWP water with 5,000 afy of that amount subcontracted to the UWCD. The UWCD has designated 2,198 afy of SWP water for use by the City.⁷⁸

DWR estimates it will be able to deliver 85 percent, or 3,563,951 af, of requested SWP water in 2017.⁷⁹ The estimated demands by SWP contractors for deliveries of Table A water, 4,172,000 af per year, is assumed to be the maximum delivery SWP delivery amount for the 2016 Delivery Capability Report. DWR considered several factors, including existing conditions, SWP operational constraints such as the conditions of the recent Biological Opinions for Delta Smelt, Salmonids and Longfin Smelt incidental take permit, and 2017 contractor demands. DWR may revise allocations if warranted by the year's developing hydrologic and water supply conditions.

Historical allocation made by the SWP for the state as a whole and for the Ventura County Watershed Protection District (WPD) are represented in the **Table 12, SWP Historical Deliveries: 2010–2017**.

76 City of Santa Paula, *Final UWMP 2016 Update* (August 2017), Table 6-9.

Surface Water

The Santa Paula Creek has been and remains a valuable source of water for the City. The Creek has a drainage area of approximately 40 square miles⁸⁰. The City owned the rights to the first 12 cubic feet per second (5,386 gallons per minute) of flow within the Santa Paula Creek.⁸¹

Santa Paula Creek facilities are located off the east side of Highway 150 approximately 3.5 miles north of Highway 126. Water is diverted to a 27-inch concrete pipe and flows by gravity into the 500,000-gallon Canyon Reservoir. From the Canyon Reservoir water either flows by gravity or is pumped by each irrigation customer.⁸²

On 17 February 1998, the City entered into a lease and agreement with the Canyon Irrigation Company concerning the operation, maintenance, and capacity rights of the Canyon Irrigation System and associated surface and groundwater rights. Per the terms of the agreement⁸³, the City transferred: (1) its

80 Santa Paula Water Works, *Hydrogeologic Assessment of the Santa Paula Groundwater Basin*, prepared by Richard C. Slade & Associates (1995).

81 Santa Paula Water Works, *Water System Report* (1993).

82 City of Santa Paula, *Final UWMP 2016 Update* (August 2017), 67.

83 City of Santa Paula, *Lease and Agreement Regarding the Canyon Irrigation System Between City of Santa Paula and Canyon Irrigation Company*, 1998.

obligation to provide irrigation water service to the Canyon Irrigation System customers; (2) its financial obligation of implementing system maintenance and capital facilities replacement and repairs; (3) all real property and appurtenant facilities necessary for operation of the system; and (4) groundwater rights to the Santa Paula Basin of 673 af. Additionally, the City leased the full capacity of the Canyon Irrigation System and the exclusive right to divert surface water sources flowing in the Santa Paula Creek to the Canyon Irrigation Company. In accordance with the lease and agreement, the City will purchase an annual average of 500 afy of surface water from Santa Paula Creek (or, at the option of the Canyon Irrigation Company, water from other sources, which is surplus to the irrigation needs of its members), for a total of no less than 5,000 af during a 10-year period commencing February 17, 1998. During the subsequent 20-year period, the City has the right to continue to purchase an average of 500 afy of surplus water supplies. If available, the City may also purchase additional surplus water supplies beyond the 500 afy mentioned previously from the Canyon Irrigation Company throughout the next 30 years.⁸⁴

The City currently wheels the 500 afy of surface water from Santa Paula Creek to Farmers Irrigation Company, which uses the surface water in lieu of pumped groundwater, and the City gains 500 afy groundwater pumping credits in the Santa Paula Basin.⁸⁵

Recycled Water

Construction of the new Santa Paula Water Recycling Facility (WRF) was completed early 2010. The city of Santa Paula purchased the facility on May 1, 2015. The WRF has a permitted dry-weather capacity of 4.2 mgd and permitted wet-weather (also maximum) capacity of 8.0 mgd. The City WRF produces water that meets California Title 22 regulations for recycled water. At present, recycled water is available within the City of Santa Paula area however, there is no infrastructure. The 2016 UWMP estimated recycled water urban demand within the City (and adjacent areas) would be approximately 2,000 afy by the year 2040, as identified in **Table 13, Projected City of Santa Paula 2016 UWMP Recycled Water Demand (afy).**

84 City of Santa Paula, *Final UWMP 2016 Update* (August 2017), 67.

85 City of Santa Paula, *Final UWMP 2016 Update* (August 2017), 67.

Source: City of Santa Paula, Final 2016 UWMP Update (August 2017). Table 4-5.

Note: All values rounded to the nearest acre-foot.

^a For planning purposes, existing landscape areas with irrigation will remain on potable water until such time that areas are converted to recycled water.

^b All new community landscape areas, including golf courses, will be designed to be irrigated with recycled water (with potable water as backup supply).

^c For planning purposes, the City estimates construction and operation of one new golf course (associated with Adams Canyon). If a golf course is not built or in operation, then recycled water could be sold to agriculture or beneficially used for groundwater recharge.

^d For planning purposes, City's recycled water program may include potential sale of recycled water for agricultural irrigation.

^e Not anticipated at this time.

^f Estimated at 5 percent of total new demands.

^g Total amount of recycled water available estimated to be 2,000 afy based on Santa Paula WRF influent and effluent flows for the period 2010–2015. For planning purposes, the 2,000 afy is distributed equally from 2020 to 2040.

Projected use of recycled water may include approximately 1,050 afy of urban landscape irrigation. At present, the urban landscaped areas proposed to be irrigated with recycled water will generally be within new developments constructed with recycled water infrastructure. In general, the initial phases of the recycled water program will not provide recycled water to existing urban landscaped areas due to the complexities and cost associated with converting to recycled water use. An additional 950 afy may be available for agricultural irrigation. However, one City report identified up to 13,590 afy of potential recycled water demand from local agricultural interests. Therefore, estimates for recycled water supply and demand are considered to be conservative.⁸⁶

Although the potential may exist in the future, the City of Santa Paula is not developing plans for groundwater recharge.⁸⁷ The Judgment does not preclude the recharge of the Santa Paula Basin, and indeed includes provisions for potential recharge. According to the Judgment, such storage would require approval of the TAC, must not adversely impact the water quality of the Santa Paula Basin, and must not cause injury to any vested rights. In the event the storage of water causes the Santa Paula Basin to spill,

⁸⁶ City of Santa Paula, Final UWMP 2016 Update (August 2017), 78.

⁸⁷ City of Santa Paula, Final UWMP 2016 Update (August 2017), 78.

the first water lost to the Santa Paula Basin is deemed to be the stored water. Furthermore, title is retained to water stored underground, and stored water (minus losses) may be pumped in addition to the approved pumping allocations, provided no injury is caused to any intervener or party to the Judgment. In other words, if the City recharged 1,000 afy to the basin, they would be entitled to pump an additional 1,000 afy above and beyond their stipulated allocation.⁸⁸

Currently there are no recycled water systems in the proposed Project vicinity. However, the 2012 Wastewater Master Plan has included West Area 2 to have a future wastewater flow of 0.082 million gallons per day or 919 af per year during an average dry-weather season.⁸⁹ The proposed Project includes an on-site recycled water distribution system to irrigate the greenbelt and other irrigation areas. This will allow the Santa Paula West Business Park to make use of recycled water when the City completes its planned recycled water plan and extends a line to the point of connection in the railroad right of way at Beckwith Road.⁹⁰

The proposed Specific Plan recycled water system would operate via a proposed 12-inch distribution main constructed in Faulkner Road, within the City limits. This terminus would become the main POC for the proposed Project. The proposed distribution system will be comprised of 6-inch mains from the POC of the City's recycled water system.

3.2 ANALYSIS OF WATER SUPPLY AND DEMAND

The available supplies and water demands for the City's service area were analyzed to assess its ability to satisfy demands during three scenarios: a normal water year, a single dry year, and multiple dry years.

This WSA addresses the City's water supply and demand as it relates to a variety of concerns including:

1. Information and data available from the City's Final 2016 UWMP Plan Update,
2. Issues related to water supply reliability relating to nongroundwater sources (Santa Paula Creek, and SWP water),
3. Consideration of information available from the DWR's *State Water Project Final Delivery Capability Report July 2015*.

88 City of Santa Paula, *Final UWMP 2016 Update* (August 2017).

89 City of Santa Paula, *Wastewater System Master Plan* (June 2012).

90 City of Santa Paula, *Santa Paula West Business Park Specific Plan* (amended October 2016).

Table 14, Projected Supply Reliability by Source, illustrates the assumptions associated with projected supply reliability by source and is used in the following discussion of City water supply and demand scenarios as they relate to the proposed Project.

Table 14
Projected Supply Reliability by Source

Supply Sources	Normal Water	Single Dry	Multiple Dry Years		
	Year	Year	Year 1	Year 2	Year 3
City Wells	100%	100%	100%	100%	100%
Santa Paula Creek	100%	100%	100%	100%	100%

Source: City of Santa Paula, Final 2016 UWMP Update (August 2017), Appendix D, Table 7-1.

Average and Dry Year Water Supply and Demand

The following tables provide the City's projected urban water supplies and demands in an average year, a single dry year, and multiple dry years.

Table 15, Supply and Demand Comparison 2016 UWMP—Average Year (afy), shows the City's projected urban water supplies and demands in an average year based on the 2016 UWMP.

Table 16, Supply and Demand Comparison 2016 UWMP—Single Dry Year (afy), shows the City's projected urban water supplies and demands in a single dry year based on the 2016 UWMP.

Table 17, Supply and Demand Comparison 2016 UWMP—Multiple Dry Years (afy), shows the City's projected urban water supplies and demand through 2040. According to the UWMP, the City's sources of supply are adequate for multiple dry years, for a 20-year period based on the 2016 UWMP.

Note: afy = acre-feet per year.

Project Supply and Demand

The proposed Project will demand 39.7 afy at full build-out (see **Table 2**).

The estimated supply to West Area 2 per the 2016 UWMP Update is 87.7 afy.⁹¹ The estimated water demand for the proposed Project is approximately 39.7 afy (20.4 afy for Commercial/Light Industrial use, 1.5 afy for Light Industrial use, and 17.8 afy for landscape irrigation). The potable demand of 21.9 afy for the Commercial/Light Industrial and Light Industrial uses, is approximately 25 percent of the West Area 2 total estimated amount. The landscaped areas will be irrigated using recycled water to be delivered from the City's wastewater treatment plant.

91 City of Santa Paula, Final UWMP 2016 Update (August 2017), 46, Table 3-2, (1,905,750 square feet of development at 15 gal/sq. ft./year is 87.7 afy).

The Project will replace existing agricultural uses on the site. As such, water currently used for agricultural irrigation will be used instead for Project consumption. Currently agricultural uses on the Project Site consume approximately 281.1 afy (average during the past 5 years; see **Table 3**). As such, the proposed Project's consumption of 39.7 afy will be a net reduction in total water use of 241.4 afy.

It should be noted that the West Area 2 Planning Area has an estimated supply of 87.7 afy based on future development. The proposed Project could utilize a portion of this allocation. However, with the removal of the agricultural uses currently on the Project Site, the Project can use a portion of the existing water currently used for irrigation. It should be noted that this portion of the pumped water will be pumped instead by the City from other wells, and not from the current well on site.

The Project will use recycled water (17.8 afy) that will be available from the City's wastewater treatment facility for irrigation; this will further reduce the demand on potable water supplies. The City's 2016 UWMP forecast having between 400 afy (2020) and 2,000 afy (2040) of recycled water available for use (see **Table 13**). Based on these forecasts, the Project will require only a portion of the recycled water (4.45 percent in 2020 and 0.89 percent in 2040).

Table 18, Project Supply and Demand Comparison 2016 UWMP—Average Year (afy) shows the proposed Project water demand as a percent of total supply throughout various milestones in the build-out schedule. By 2027 (build-out), the Project is estimated to demand 39.7 afy of water. Water demand from the Project based on the 2016 UWMP represents 0.61 percent of the City's total projected urban water demand in 2017, decreasing to 0.41 percent in 2037. The projected demand for the Project will account for only a small fraction of the projected City-wide demands.

Table 18
Project Supply and Demand Comparison 2016 UWMP—Average Year (afy)

3.3 CONCLUSIONS

City of Santa Paula Service Area

Based on the information, analysis, and findings documented in this WSA, substantial evidence exists to support a determination that there will be sufficient water supplies to meet the current and future demands of the Project in addition to all forecasted demands for the 20-year period from initial development (2017 to 2037). This is based on the volume of water available in the Santa Paula Basin, and water rights and water supply contracts. The City has committed sufficient resources to further implement the primary elements of the Final 2016 UWMP, which include the purchase of additional water supplies, water conservation, and source substitution (use of agricultural irrigation water and recycled water).

The domestic water supply (potable) for the Project will be supplied by water from on-site water well pumping from the Santa Paula Basin that will ultimately be transferred to the City, encompassing the City of Santa Paula. Groundwater storage will be used in dry years to make up the difference between supply and demand. The Santa Paula groundwater basin has an “assumed initial yield” of the basin is 33,500 afy and currently contains about 26 million af and acts as a very large reservoir. It is capable of meeting the water demands of the City for extended normal and drought periods.

As discussed in the Final 2016 UWMP and this WSA, the City of Santa Paula has many programs to eliminate overdraft and maximize the water resources recycled wastewater, and water conservation including water rates, landscaping ordinance, outreach and education.

The proposed Project falls within the boundaries of the West Area 2 Expansion Area. At 53.81 acres, the Santa Paula West Business Park Specific Plan would take up approximately 43 percent of the 125-acre planned expansion. The City’s General Plan projects an estimated water demand of 87.7 afy for West Area 2. As such, the proposed Project has a projected demand of 39.7 afy, which is included in the General Plan. However, the Project will replace existing agricultural uses that extract well water from the Santa Paula Basin; as such, the Project will result in a net reduction (241.4 afy) of water use on site at build-out.

Currently, the entire potable water supply for the City is obtained by pumping from the Santa Paula Basin. The City has obtained additional groundwater pumping rights through a wheeling agreement with the Canyon Irrigation Company. The potential future water supplies include groundwater rights transfers to the City as new development occurs, City acquisition of potentially available groundwater allocations within the Santa Paula Basin, recycled water, and groundwater production from the Fillmore Basin.

The SPBPA and TAC monitor current and future groundwater pumping within the Santa Paula Basin. The City is not limited to its allocation in any single year, but may produce as much as seven times its annual average allocations during a 7-year period. There are no restrictions regarding pumping in single dry- or

multiple dry-water years subject to court order. As discussed earlier, the Santa Paula Basin Yield Study did not recommend that restrictions be imposed on the amount of groundwater that can be pumped during dry periods. Therefore, groundwater pumping by the City is not anticipated to be subject to any reductions in the dry year analysis.

Recycled water production will not be affected by single dry- or multiple dry-water years. Recycled water supply is directly related to wastewater generation, which is generally associated with indoor potable water use. Currently, there are no restrictions within the City regarding the use of potable water during dry periods. Additionally, the currently proposed uses of recycled water are restricted to nonpotable irrigation that, if reduced during dry periods, would have little or no impact on the community. Therefore, it is not anticipated that the recycled water supply will be reduced during dry periods.

SWP dry-year restrictions are not known due to the lack of specificity regarding how the water will be delivered. For the purposes of this analysis, it is assumed that no SWP water will be delivered in the near future. However, the City may trade, transfer, and/or sell a portion of the SWP water rights to augment existing supplies.

Project Water Requirements

As shown in this WSA analysis, the projected demand for the proposed Project will account for only a small fraction of the total projected demands set forth in the City's General Plan, Land Use Element, for the total projected demands through 2037.

The proposed Project-specific water demand at build-out is 39.7 afy, which includes 21.9 afy of potable use and 17.8 afy for landscape irrigation that can be supplied with recycled water.

The proposed Project incorporates features that reduce the overall water demand and provide for a reduction in use. As previously explained, it is assumed that Project water demand is included within the estimated West Area 2 supply and demand projections necessary to recharge the groundwater basin. In 2037, the proposed Project would utilize approximately 0.41 percent of the total City projected available supply for 2037 based on the Final 2016 UWMP Update. As such, the proposed Project's demand is within the allowable demand necessary to manage the groundwater basin.

RE: Proposed Santa Paula West Business Park Specific Plan Project, City of Santa Paula, Ventura County, California

Dear Ms. Minsk and Ms. Nelson:

Government Code §65352.3 requires **local governments** to consult with California Native American tribes identified by the Native American Heritage Commission (NAHC) for the purpose of protecting, and/or mitigating impacts to cultural places in creating or amending general plans, including specific plans. Attached is a consultation list of tribes traditionally and culturally affiliated with the area that may have cultural places located within the boundaries of the project referenced above.

As a part of consultation, the NAHC recommends that local governments conduct record searches through the NAHC and California Historic Resources Information System (CHRIS) to determine if any cultural places are located within the area(s) affected by the proposed action. The form to request searches of the NAHC Sacred Lands File (SLF) can be found at <http://nahc.ca.gov/wp-content/uploads/2015/08/Local-Government-Tribal-Consultation-List-Request-Form-Update.pdf>.

Local governments should be aware that records maintained by the NAHC and CHRIS are not exhaustive, and a negative response to these searches does not preclude the existence of a cultural place. A tribe may be the only source of information regarding the existence of tribal cultural resources.

If you receive notification of change of addresses and phone numbers from tribes on the attached list, please notify me. With your assistance we are able to assure that our consultation list contains current information.

If you have any questions, please contact me at my email address: gayle.totton@nahc.ca.gov.

Sincerely,

A handwritten signature in blue ink that reads "Gayle Totton".

Subject: Senate Bill 18 Consultation Notification for the proposed Santa Paula West Business Park Specific Plan (Project No. 13-CDP-04) (City of Santa Paula/County of Ventura)

Dear Ms. Tumamait-Stenslie:

The City of Santa Paula has completed the Draft Environmental Impact Report (DEIR) for the Santa Paula West Business Park Specific Plan project and is starting the 45-day public review period required by the California Environmental Quality Act (CEQA) process. In addition, since the project involves a Specific Plan, the City is contacting and consulting with California Native American tribes in compliance with Senate Bill 18 (SB18). As such, the City of Santa Paula is sending the Barbareño/Ventureño Band of Mission Indians this consultation notification in compliance with SB18. The purpose of this consultation notification is to obtain any questions, comments, or concerns you may have pertaining to the proposed project. The City of Santa Paula values your input regarding the proposed project and encourages you to submit comments. As defined in SB18, this notification begins the 90-day comment period which will run concurrent with the 45-day CEQA review period.

The City of Santa Paula is the lead agency for the Santa Paula West Business Park Specific Plan project. The Specific Plan site is a 53.81-acre (agricultural land) area near the western boundary of the City of Santa Paula and currently lies within the unincorporated County of Ventura. The site is bound to the north by Telegraph Road, to the south by SR 126, to the east by existing industrial and commercial development in the existing City limits, and to the west by the Adams Barranca and agricultural operations. The site is bisected by the Ventura County Transportation Commission (VCTC) railroad right-of-way.

The Specific Plan would guide future land use development on approximately 53.81 acres of the City's 125-acre West Area 2 designation. West Area 2 was included as an expansion area in the City's General Plan, which was approved by the City of Santa Paula in 1998. This designation allows for a variety of manufacturing, research and development, professional office, and limited commercial uses, with integrated vehicular circulation, pedestrian walkways, and infrastructure. The land uses envisioned within the Specific Plan would be a mix of low-intensity industrial (such as light manufacturing or research and development), professional offices, and supporting commercial businesses. These uses are allowed in the Commercial/Light Industrial and Light Industrial zones.

If you have any questions or wish to schedule a formal consultation, please do not hesitate to contact me at (805) 933-4214 x244 or via e-mail at jminsk@spcity.org. You may also contact Trayci Nelson, the Project Manager, at (562) 202-2492 or via email at tnelson@mbakerintl.com.

Sincerely,

Janna Minsk, AICP
Planning Director

APPENDIX F

Baseline Traffic and Growth Validation

MEMORANDUM

Date: September 18, 2018
To: Chad Penrod, McGaelic Group, Ltd.
From: Netai Basu & Vivian Lee, Fehr & Peers
Subject: Santa Paula West Business Park Specific Plan EIR – Traffic Baseline and Growth Forecast Validation

LA18-3037.00

EXECUTIVE SUMMARY

In early 2015, Fehr & Peers completed the “Traffic Impact Analysis for the Santa Paula West Business Park Specific Plan” (March 2015, Fehr & Peers). That study was based, in part, on traffic counts collected in 2014. The draft EIR was released in November 2016, and the final EIR is currently in preparation. Because four years have passed since the baseline counts were taken, City staff asked for a comparison of the 2014 baseline traffic volumes with more recent traffic volumes in order to confirm the reasonableness of the conclusions of the EIR study. In response, Fehr & Peers collected more recent traffic counts, compared it with the baseline data used in the EIR, and conducted other checks to determine whether and how local conditions have changed. This memorandum presents a summary of the new data collected and comparisons made, leading to a determination that the conclusions of the traffic study remain valid.

DATA COLLECTION

The 2015 traffic study analyzed weekday AM and PM peak hour conditions at 16 intersections near the project site, as well as five freeway segments. More recent traffic counts from February 2016 were obtained from the City of Santa Paula’s General Plan Update, Existing Conditions report for 13 of the 16 existing study intersections. Traffic volume data from Caltrans was also reviewed to determine the level of change near the project site at the five freeway segments. In addition, 24-hour daily traffic counts were collected at eight locations in May 2018 and compared with the 2016 daily counts in the Santa Paula General Plan Update. New counts can be found in the attachment to this memo. Recent baseline counts from Ventura County Transportation Commission (VCTC) were also requested but the counts were not deemed relevant for the purposes of this memo because they were too old (Year 2012).

Additionally, lane configurations and signal phasing were field-checked in May 2018. Based on the recent field observations, changes were identified at only one location, Intersection 6. The northbound approach at Steckel Drive & Main Street has been reconfigured from one shared through-left and one shared through-right to one shared left-through lane and one right-turn lane. This appears to be related to a curb extension (installed as part of the Santa Paula Bike Trail) on the far side of the intersection.

SUMMARY OF KEY VOLUME COMPARISONS

Intersection Volumes

A comparison of the existing 2014 volumes and the cumulative base 2031 volumes presented in the draft EIR traffic study is shown in **Table 1**. By 2031, the volumes are forecasted to increase between 11.7% and 139.3%. This increase factors in an ambient growth rate of 0.5% and traffic increase from related projects in the area. The compounded annual growth rate ranges from 0.7% to 5.3% during the AM peak hour and 0.8% to 5.2% in the PM peak hour. The compounded annual growth rate for total intersection volumes is 2.2% during the AM peak hour and 2.1% during the PM peak hour.

Table 2 shows a comparison of the weekday AM and PM peak hour intersection between years 2014 and 2016 at 13 of the 16 study intersections. As shown, the changes in volume range from -89 to 206 in the AM peak hour and from -162 to 446 in the PM peak hour. The percentage change in total intersection volumes at each count location between 2014 and 2016 ranged from -14.2% to 10.2% in the AM peak hour and from -11.2% to 43.2% in the PM peak hour. The compounded annual growth rate ranges from -7.4% to 5% in the AM peak hour and -5.8% to 19.7% in the PM peak hour. The count locations are shown in **Figure 1**.

The total intersection volumes both increased and decreased at the 13 intersections analyzed in the draft EIR. Most increased or decreased within 10% except for Intersection 6 (Steckel Drive & Main Street), where the percentage change in total intersection volumes decreased by 7% in the Am peak hour and increased by about 43% in the PM peak hour. Intersection 8b (Peck Road/Main Street & Telegraph Road/Harvard Boulevard) also increased by 14.1%; however, the higher percentage increase in traffic is largely due to the small volume of traffic at this location. Overall, the change in total intersection volume throughout the study area decreased by about 1.0% in the AM peak hour and increased by 2.7% in the PM peak hour over the course of two years. The compounded annual growth rate for total intersection volumes was -0.5% during the AM peak hour and 1.4% during the PM peak hour.

³ CAGR = Compounded annual growth rate

Roadway Segment Volumes

Table 3 shows a comparison of the 24-hour daily volumes between years 2016 and 2018 for eight roadway segments. New 2018 counts were collected to compare to the 24-hour daily volumes reported in the City of Santa Paula's General Plan Update. The changes in volume range from -1,243 to 2,371. The percentage change in daily volumes at each count location between 2016 and 2018 ranged from -10.7% and 37.8%. Additionally, the compounded annual growth rate ranged from -5.5% to 17.4%. The count locations are shown in **Figure 1**.

Of the eight count locations, half of the locations saw an increase in volume and half saw a decrease in volume. The highest increase occurred on Telegraph Road, west of Peck Road where the volume increased by 37.8%, followed by Briggs Road between Faulkner Road & Telegraph Road, where the volume increased by 23.8%. However, the counts from the General Plan Update and the new counts taken in May 2018 may vary in exact location on the roadway segment, which may account for the higher increases. Overall, the change in total ADT volumes increased by 3.1% over the course of two years. The compounded annual growth rate for all roadway segments was 1.5%.

Freeway Segment Volumes

Table 4 shows a comparison of the Caltrans peak hour bi-directional volume between years 2014 and 2016 for the five existing freeway segment locations. The changes in volume range from -100 to 600. The percentage change at each count location between 2016 and 2018 ranged from -3.8% to 18.5%. Additionally, the compounded annual growth rate ranged from -1.9% and 8.8%. The count locations are shown in **Figure 1**.

The highest increase in volumes occurred on the SR-126 between 10th Street and Palm Avenue. This segment saw an 18.5% increase during the two-year period. Overall, the change in volumes for all freeway segments was 3.4% with a compounded annual growth rate of 1.7%.

Table 3: Comparison of 24-Hour Roadway Segment Volumes Between Years 2016 and 2018

Roadway Segment		Year 2016 24-Hr Volume ¹	Year 2018 24-Hr Volume ²	Delta (2018-2016)	Change in Volume	CAGR ³

FUTURE TRAFFIC VOLUMES

Related Projects and Ambient Growth Factor

Because the project future traffic volumes are based in part on traffic volumes from 18 related projects, more recent information was collected to update the trip generation estimates from what is in the original traffic impact study. In 2014, there were 18 related projects with a totaling 49,538 daily vehicle trips, 4,609 AM peak hour trips, and 5,346 PM peak hour trips. As of May 2018, there are two additional projects that have been added to the list for a total of 50,458 daily trips, 4,708 AM peak hour trips, and 5,432 PM peak hour trips. One project is a fast food restaurant located approximately 1.5 miles from the project site and the other is an industrial site located south of SR-126, about a half mile south of the project site. In addition, six related projects have since been completed and are in operation as of May 2018. **Table 5** shows the updated related projects list with corresponding trip generation.

An ambient growth factor of 0.5% was used to determine future traffic volumes in the original traffic impact study. The current SCAG travel demand model was reviewed to identify the long-term level of traffic growth anticipated near Santa Paula. Year 2016 and Year 2040 forecasts from the eight selected roadway segments were compared to determine the anticipated growth rate over the 24-year period. **Table 6** shows that the compounded annual growth rate ranged from -0.33% to 1.55% in the AM peak hour and -0.20% to 0.44% in the PM peak hour. The compounded annual growth rate for the total volumes for all roadway segments was less than 0.1% for both the AM and PM peak hours.

² CAGR = Compounded annual growth rate

CONCLUSIONS

A comparison of more recent traffic counts and intersection operating conditions with the existing 2014 conditions analysis presented in the traffic study shows that there have been minor increases and decreases at certain locations. However, the overall compounded annual growth in the area has been less than what was estimated in analysis of the traffic study. The traffic study shows that total intersection volumes are anticipated to increase by over 2% per year while the comparison of recent intersection, roadway segment, and freeway segment volumes shows that growth has increased by less than 2% per year since 2014. The higher percentage of growth at certain locations does not appear to be a result of any systemic change in the area, nor do we believe it would change the existing LOS in the original study based on the 2014 volumes. The SCAG travel demand model also anticipates a slower rate of increase in growth over the next 24 years.

The addition of related projects is not expected to affect the results of the original analysis given their size and location. As for the change in lane configuration to Steckel Drive & Main Street, LOS was rerun for the intersection for cumulative plus project scenarios, with and without the Beckwith Road extension. The results show that had the EIR analysis accounted for the lane reconfiguration, forecasted LOS for both scenarios would remain unchanged and no significant impact would occur.

Based on this data and analysis, we have determined that the conclusions of the original traffic impact study remain valid and that no new significant impacts would occur that are not already identified in the original study.

If you have questions or require additional information, please call us at (213) 261-3050.

1.0 INTRODUCTION

1.1 PROJECT BACKGROUND

When a Final Environmental Impact Report (EIR) has been certified for a project, the California Environmental Quality Act (CEQA) provides for the update of the information in the Final EIR to address changes to a project or changes to the circumstances under which a project will occur. An Addendum to a Final EIR may be prepared if changes or additions to the EIR are needed, but none of the conditions calling for a Subsequent EIR or Supplemental EIR as defined in the CEQA Guidelines have occurred.

The City of Santa Paula (City) certified the Final EIR for the approximately 54-acre Santa Paula West Business Park Specific Plan Project (“Specific Plan” or “Project”) in February 2019. The Specific Plan was proposed to provide a comprehensive set of plans, exhibits, regulations, conditions, and programs for the orderly development of a portion of the West Area 2 Expansion Area as defined in the City’s General Plan with commercial and light industrial uses.

As required by CEQA, the City adopted findings of fact for the significant impacts identified in the Final EIR and a statement of overriding considerations for those impacts identified as significant and unavoidable after the incorporation of all feasible mitigation measures which were adopted for the Project, consisting of several discretionary actions, including (1) approval of a General Plan Amendment, (2) adopting the Santa Paula West Specific Plan as rezoning for the property within the Specific Plan Area, (3) approval of a Master Vesting Tentative Map, (4) approval of Water Supply Assessment; and (5) authorization to file an application with the Ventura Local Agency Formation Commission (LAFCO) for the purpose of reorganizing (annexing) the Project Site within the City’s jurisdiction in accordance with the Cortese-Knox-Hertzberg Government Reorganization Act of 2000. In February 2013, the City filed an application with the Ventura LAFCO to reorganize (annex) the Project Site to the City of Santa Paula.

Subsequent to the filing of the annexation application, the Ventura County Watershed Protection District (VCWPD) requested that the City modify the drainage and flood control plan for the Project to provide for additional storage volume for floodwater. This Addendum to the Final EIR for the Santa Paula West Business Park Project evaluates changes to the drainage and flood control plan proposed in response to a request from the VCWPD and related changes to the approved Specific Plan. These changes are proposed to ensure the Santa Paula West Business Park Specific Plan is safe from flooding, that the Project will not adversely affect flooding conditions on adjacent properties or along FWY 126, and to maintain the existing volume of natural floodplain storage within the Specific Plan Area.

1.2 APPLICABLE REVIEW STANDARDS

When a Final EIR has been certified for a project, the CEQA and the CEQA Guidelines define standards and the procedure for an additional environmental review. Sections 15162-15164 of the CEQA Guidelines, 14 Cal. Code. Regs. §§ 15000 et seq., define the standards for determining the level of additional environmental review required when an EIR has been certified for a project.

When it can be determined, based on substantial evidence in light of the whole record, that changes to the Project or changes in the circumstances under which the Project would be undertaken constitute new information that would result in the identification of new significant impacts, or a substantial increase in the severity of significant impacts identified in the certified Final EIR, an Addendum to an EIR may be prepared. Public review of an Addendum is not required by CEQA. Instead, the information in an Addendum is to be considered with the previously certified Final EIR prior to a decision being made on the action being considered. If new significant impacts or a substantial increase in the severity of significant impacts identified in the certified Final EIR would occur, then preparation and circulation of a Subsequent or Supplemental EIR is required.

Based on review of the whole record, including the certified Final EIR, this Addendum concludes that no new significant impacts are likely to result from the proposed apartment project. This conclusion is drawn from the following findings pursuant to Section 15162(a) of the CEQA Guidelines:

1. No substantial changes are proposed in the Project that would require major revisions of the previous EIR due to the occurrence of new significant effects or a substantial increase in the severity of previously identified significant impact;
2. No substantial changes in circumstances under which the Project is undertaken would occur that would require major revisions of the previous EIR due to the occurrence of new significant environmental effects or a substantial increase in the severity of previously identified effects; and
3. No new information of substantial importance has been discovered that was not known and could not have been known with the exercise of reasonable diligence at the time the previous EIR was prepared. Specifically, a review of current conditions and the proposed Project demonstrates the following:
 - a. The proposed Project would not have one or more significant effects not discussed in the previous EIR;
 - b. Significant effects previously examined would not be substantially more severe than shown in the Final EIR;
 - c. There are no new mitigation measures or alternatives previously found not to be feasible that would now in fact be feasible that would substantially reduce one or more significant effects of the proposed Project, and that the proposed Project proponents decline to adopt; and
 - d. No new mitigation measures or alternatives that are considerably different from those analyzed in the previous EIR that would substantially reduce one or more significant effects on the environment, and that the proposed Project proponents decline to adopt, are recommended.

Based on the information contained in this Addendum, the proposed modification of the drainage and flood control plan in the Santa Paula West Specific Plan would not result in any new significant impacts or any substantial increase in severity of the significant impacts identified in the Final EIR. Additionally,

no new information of substantial importance has been identified that indicates the Project would result in any new significant impacts or any substantial increase in the severity of the significant impacts identified in the Final EIR.

2.0 PROJECT DESCRIPTION

The Santa Paula West Business Park Specific Plan (SPW Business Park Specific Plan) was approved by the City of Santa Paula in February 2019 to guide future land use development on approximately 54 acres of property in the West Area 2 Planning Area, as defined in the City's General Plan planned for commercial and light industrial facilities. West Area 2 was identified as an expansion area in the City's 1998 General Plan, indicating the City's intent to annex this area. The SPW Specific Plan allows a variety of manufacturing, research and development, professional office, and limited commercial uses, with integrated vehicular circulation, pedestrian walkways, and supporting infrastructure.

2.1 Project Location

The SPW Business Park Specific Plan Area (Project Site) is approximately 54 acres of unincorporated land located adjacent to the western boundary of the City of Santa Paula, as shown in **Figure 2.0-1: Project Location** and **Figure 2.0-2: Project Site**. The Project Site is located within the Sphere of Influence (SOI) for the City of Santa Paula as approved by the Ventura LAFCO and the voter approved City of Santa Paula CURB (City Urban Restriction Boundary).

The Project Site is located within the Santa Paula, California, 7.5-minute United States Geological Survey (USGS) quadrangle and is comprised of five parcels identified as Assessor's Parcel Numbers (APNs) 098-0-010-150, 098-0-010-160, 098-0-010-190, 098-0-010-180, and 098-0-020-040. The Project Site is bound to the north by Telegraph Road, to the south by SR 126, to the east by existing industrial and commercial development in the existing City limits, and to the west by Adams Barranca and agricultural land. The Project Site is divided by the Ventura County Transportation Commission (VCTC) railroad right-of-way. Local access is provided by Telegraph Road, Beckwith Road, Clow Road, and Todd Lane.

2.2 Project Characteristics

2.2.1 APPROVED SPECIFIC PLAN

The City of Santa Paula General Plan designates the Project Site for Mixed-Use Commercial/Light Industrial uses (C-LI). Section 16.25.020 of the Santa Paula Municipal Code (SPMC) identifies this area as SP-6, Santa Paula West Business Park.

The Santa Paula West Business Park Specific Plan is a comprehensive set of plans, exhibits, regulations, conditions, and programs approved by the City to implement the City of Santa Paula General Plan by ensuring the orderly development of the Specific Plan Area as a coordinated office/industrial/business park, including a variety of manufacturing, research and development, professional office and limited commercial uses with integrated vehicular circulation, landscaping, pedestrian walkways, and supporting infrastructure.

Project Site

Figure 2.0-3 is the **Approved Land Use Master Plan** in the Specific Plan. As shown in **Table 2.0-1: Santa Paula West Business Park Specific Plan Approved Land Use Summary**, the approved Specific Plan identifies 41.96 acres for Commercial/Light Industrial uses, 6.95 acres for roads, and 4.9 acres for Open Space/Passive uses, including drainage and flood control facilities. The Specific Plan defines a Floor Area Ratio (FAR) of 35% for Commercial/Light Industrial Land, meaning buildings may occupy a maximum of 35% of the area available for development. As 41.96 acres is designated for Commercial/Light Industrial Development, the maximum amount of development allowed by the approved Specific Plan is approximately 1.83 million square feet.

**TABLE 2.0-1
SANTA PAULA WEST BUSINESS PARK SPECIFIC PLAN
APPROVED LAND USE SUMMARY**

Land Use	Acres	Percent of Project Site
Commercial/Light Industrial (C/LI)	41.96	78.0
Roadways (approximate)	6.95	12.9
Open Space/Passive	4.9	9.1
Total Gross Area	53.81	100

Adams Barranca, located along the western boundary of the Project Site, conveys storm water from north of the site to drainpipes under the SR 126 Freeway. The current effective FEMA Flood Insurance Rate Map (FIRM) dated 01/20/2010 shows that a portion of the Project Site is located partially within Zone A, indicating there is an approximate 1% Annual Chance (100-year) of flooding due to a lack of capacity within the channel and a lack of capacity at the SR 126 undercrossing.

The approved Specific Plan includes an interceptor channel along Telegraph Road on the northern edge of the Specific Plan Area with another interceptor channel parallel to Adams Barranca from Telegraph Road to Freeway 126 and with a discharge point back into Adams Barranca upstream of the SR 126 Freeway. As shown in **Figure 2.0-3: Approved Land Use Master Plan** flood control basins were also planned along Adams Barranca north of the rail line and in the southwest corner of the Project Site.

2.2.2 PROPOSED SPECIFIC PLAN AMENDMENT

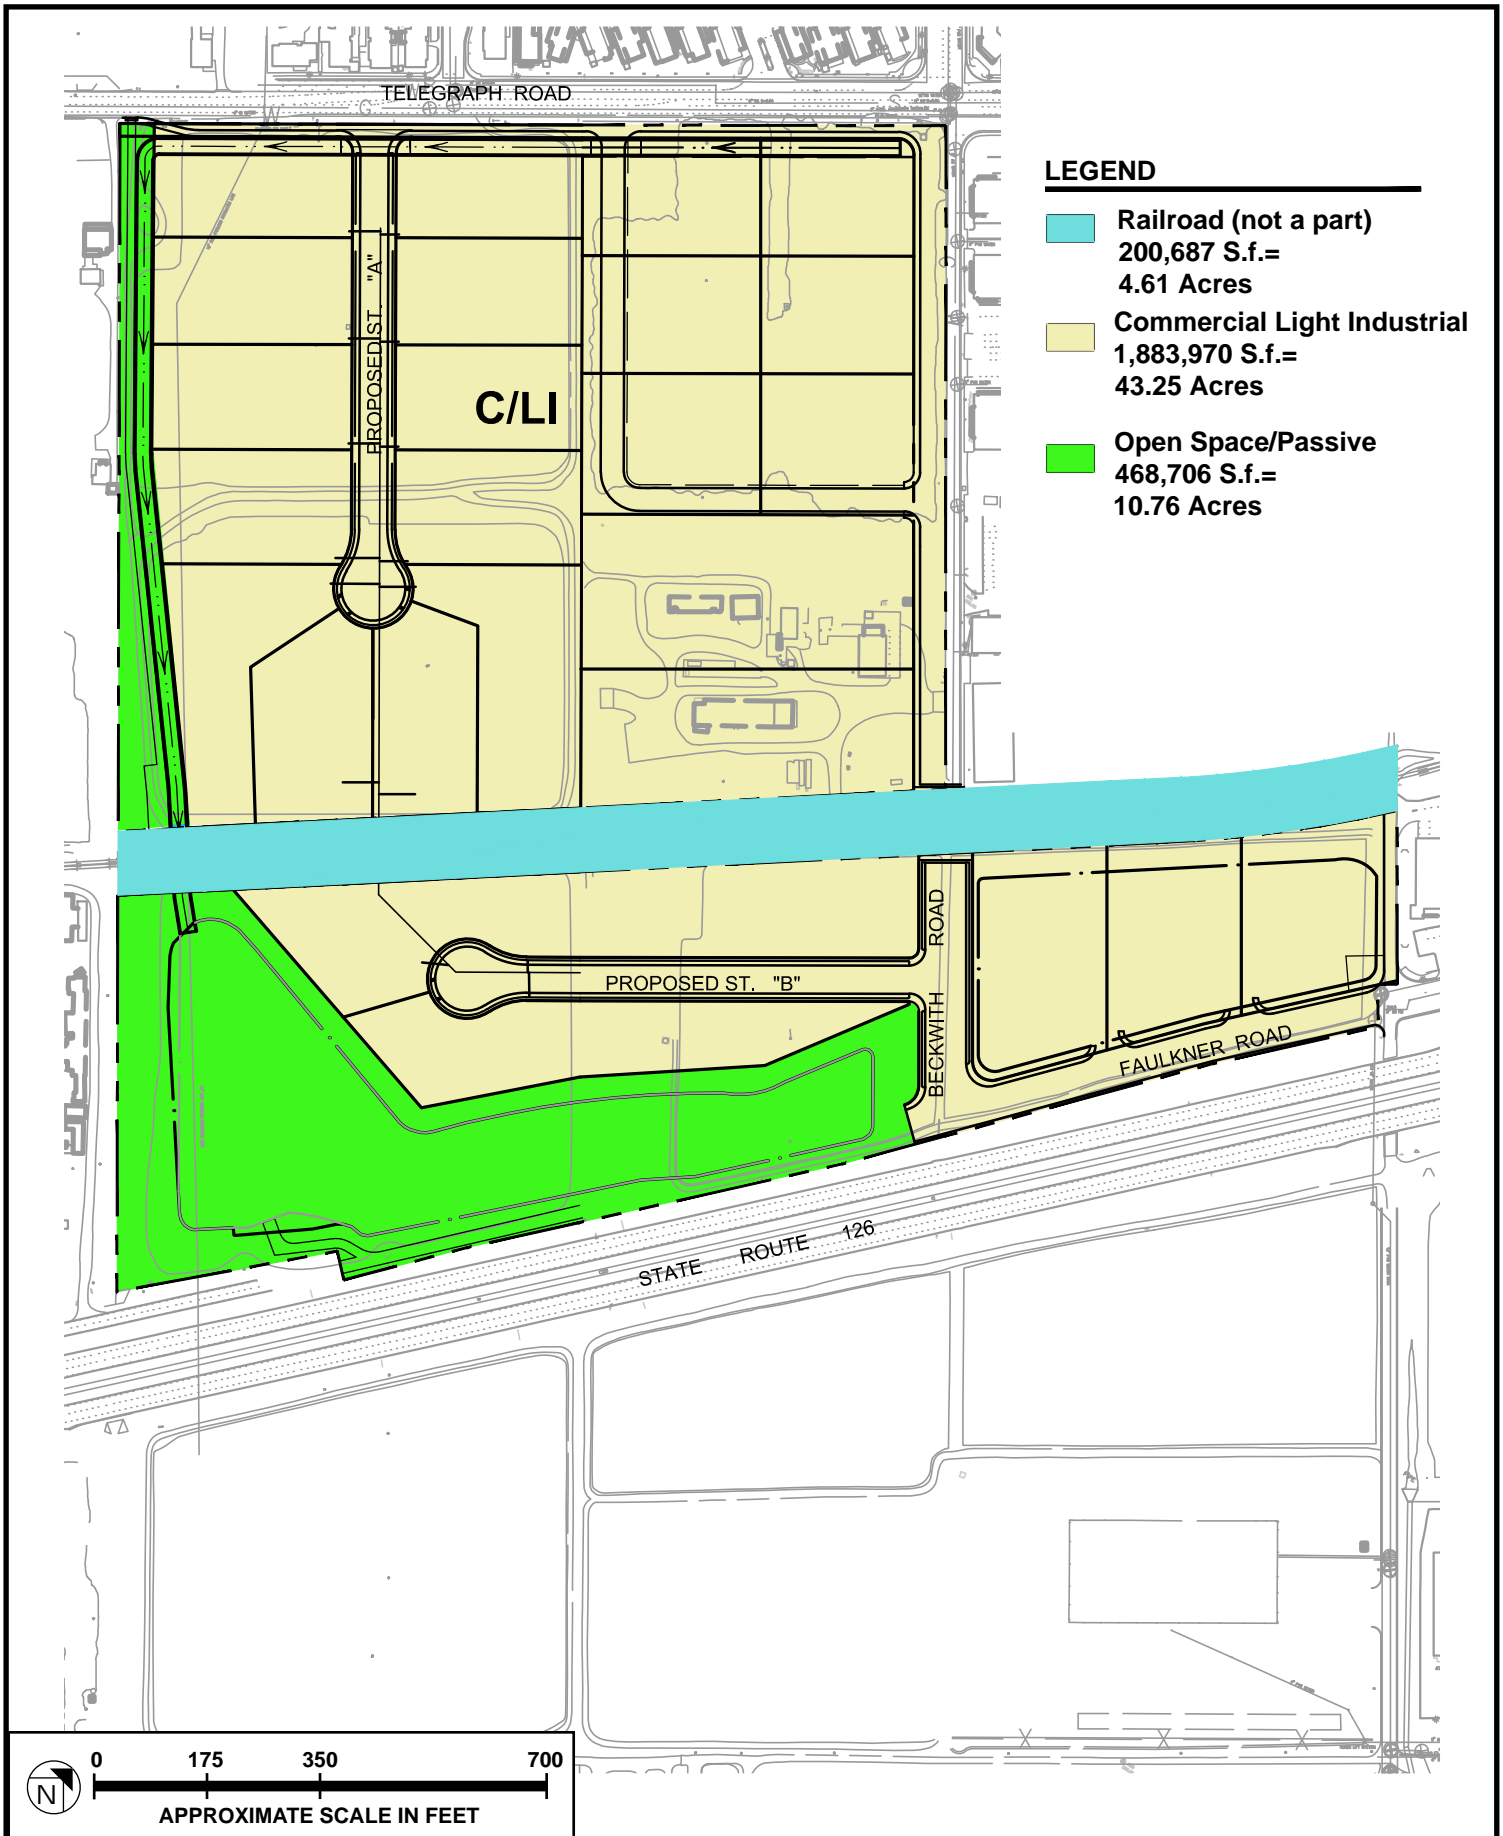

Based on consultation with the Ventura County Watershed Protection District (VCWPD), the drainage and flood control plan included in the approved Specific Plan was redesigned to ensure the Project Site would not be flooded or have any adverse effects on adjacent properties or the SR-126 Freeway, and would replace the existing natural floodplain storage on the Project Site. The proposed Specific Plan Amendment includes modifications to the drainage and flood control plan to increase the volume of floodwater from Adams Barranca that can be accommodated within the Specific Plan Area.

Figure 2.0-4 is the Proposed Land Use Master Plan and Table 2.0-2 is the Proposed Land Use Summary. Based on a new survey completed of the parcels included in the Specific Plan Area, the size of the Specific

SOURCE: Jensen Design and Survey – 2016

FIGURE 2.0-3

SOURCE: Jensen Design and Survey – 2023

FIGURE 2.0-4

Plan Area has been adjusted from 53.81 to 54.01 acres. As shown in Table 2.0-2: Santa Paula West Business Park Specific Plan Proposed Land Use Summary, the amount of the Open Space/Passive land is proposed to increase by approximately 5.86 acres to 10.76 acres to accommodate a large flood control basin in the southwest portion of the Project Site. The amount of land available for Commercial/Light Industrial Development is reduced from 41.96 acres to 36.94 acres. With this reduction, the amount of development allowed by the Specific Plan is reduced by approximately 12%, from 1.83 million square feet to 1.61 million square feet.

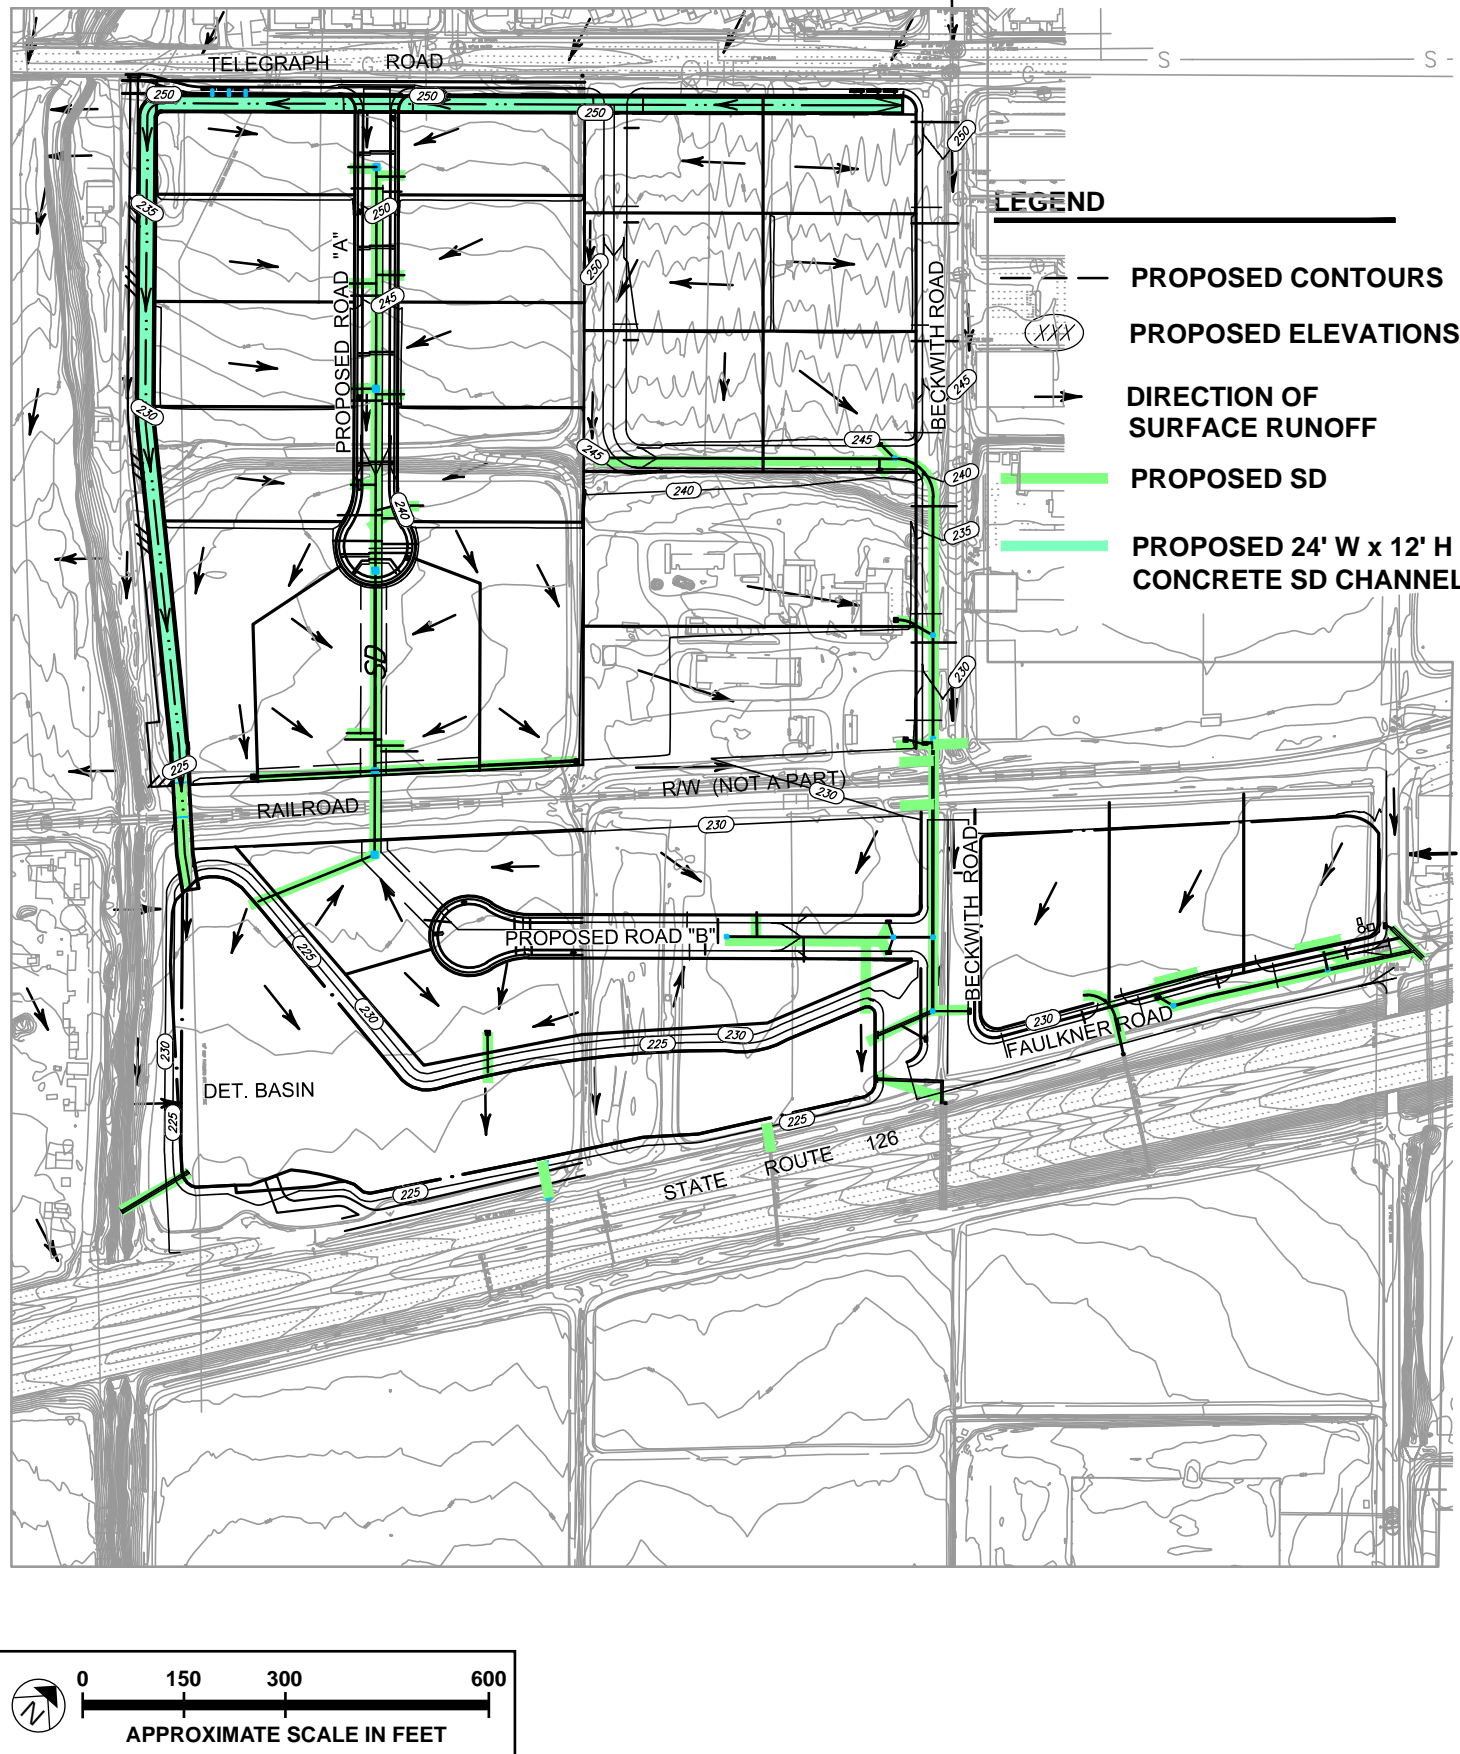

Land Use	APPROVED		PROPOSED		Change in Acres
	Acres	Percent of Project Site	Acres	Percent of Project Site	
Commercial/Light Industrial (C/LI)	41.96	78.0	36.94	68.4	- 5.02
Roadways (approximate)	6.95	12.9	6.31	11.7	- 0.64
Open Space/Passive	4.90	9.10	10.76	19.9	+ 5.86
Total Gross Area	53.81	100	54.01	100	0.20

Grading and Drainage Master Plans

The revised Drainage Master Plan is designed to meet or exceed the storm drainage requirements of the Ventura County Watershed Protection District (VCWWD) and the City of Santa Paula (on-site drainage systems), where applicable. The Conceptual Drainage Plan for the Project is illustrated in Figure 2.0-5: Conceptual Grading and Drainage Plan and Figure 2.0-6: Storm Drain Plan.

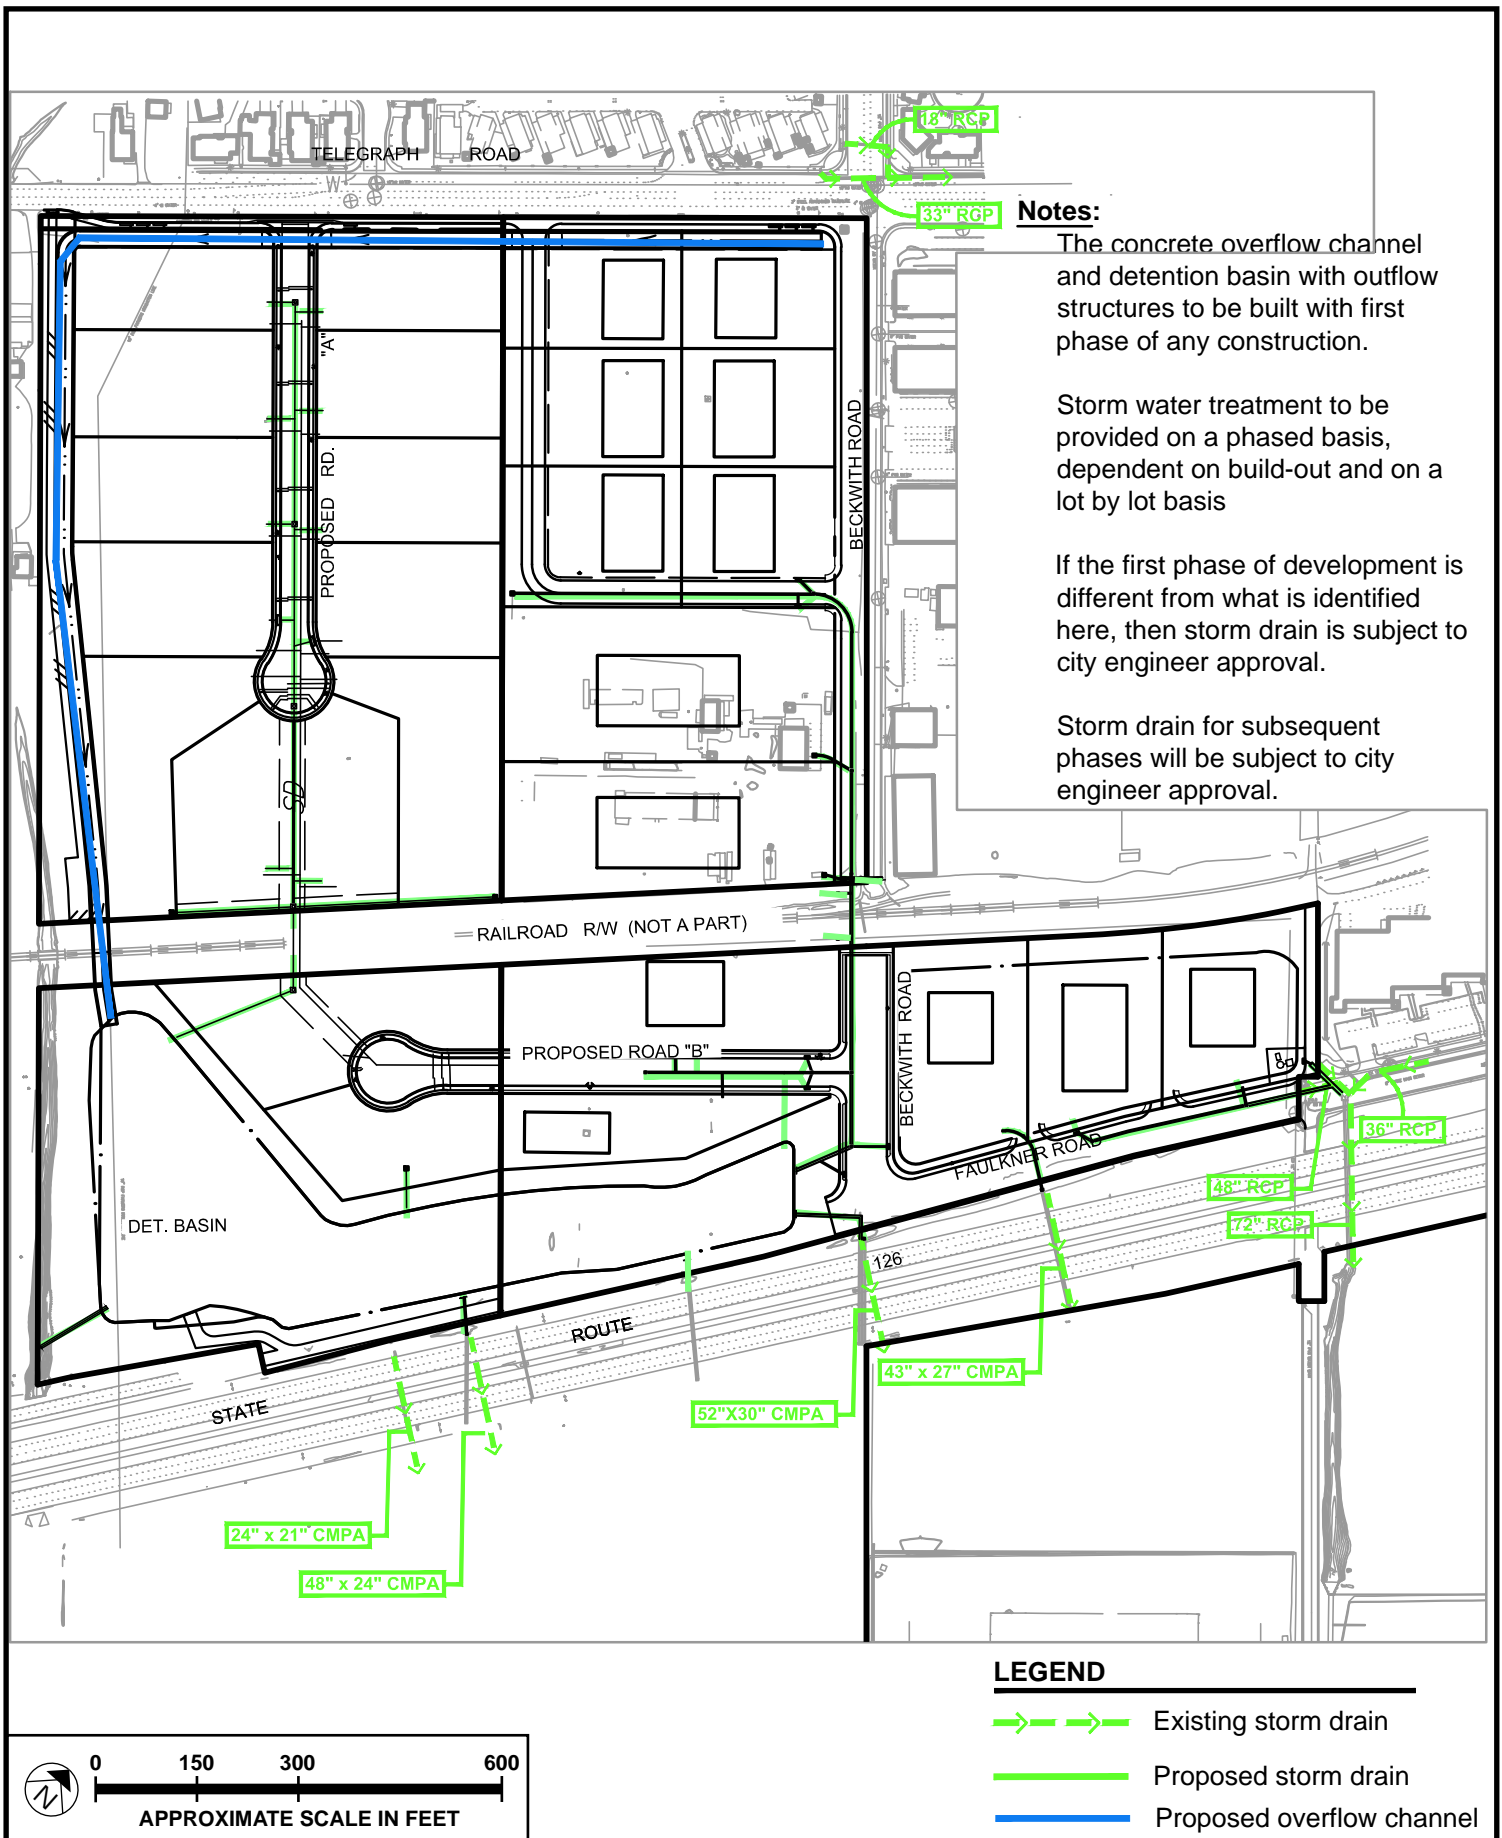

The Project Site will be graded to approximate the existing 2 percent land gradient, creating roadways and building pads in the lower areas with gradients in the 0.5 percent to 2 percent range. Elevations will be raised by up to approximately 4 feet - 6 feet above existing elevations to raise the site out of the floodplain. With the Conceptual Grading Plan in the approved Specific Plan, grading on the site would have involved approximately 80,000 cubic yards of cut and 179,000 cubic yards of fill, with approximately 99,000 cubic yards of imported soil needed. With the proposed Conceptual Grading Plan, grading on the site would include approximately 119,950 cubic yards of cut and 200,430 cubic yards of fill, with approximately 81,280 cubic yards of imported soil needed.

The proposed flood protection plan builds upon the approved flood control plan in the approved Specific Plan and is designed to meet or exceed the storm drainage requirements of both the Ventura County Watershed Protection District (VCWWD) and the City of Santa Paula (on-site drainage systems), where applicable.

FIGURE 2.0-5

Notes:

- The concrete overflow channel and detention basin with outflow structures to be built with first phase of any construction.
- Storm water treatment to be provided on a phased basis, dependent on build-out and on a lot by lot basis
- If the first phase of development is different from what is identified here, then storm drain is subject to city engineer approval.
- Storm drain for subsequent phases will be subject to city engineer approval.

LEGEND

- → Existing storm drain
- Proposed storm drain
- Proposed overflow channel

SOURCE: Jensen Design and Survey – 2023

FIGURE 2.0-6

An interceptor channel is planned to capture overflows from Telegraph Road and Adams Barranca during a 100-year storm event. Instead of discharging the flows back into Adams Barranca above the freeway, these overflows will enter a large on-site storage basin located where the 100-year flood is expected to flow over the freeway under the existing condition. This basin will collect on-site flood waters collected via the north and the west interceptor channels, provide a spillage area where flood flows will overtop the freeway similar to the existing condition, and serve as an on-site detention and stormwater quality treatment basin. Flows entering Beckwith Road from Telegraph Road to the railroad tracks will also be intercepted and collected at the Telegraph Road intersection via a series of catch basin inlets and storm drains in order to minimize the flows discharging south on Beckwith Road and overtopping the railroad tracks. Along the east end of the project site to the Beckwith Road extension, an earthen interceptor channel between the building pad areas and the railroad tracks will collect runoff that overflows the tracks and convey these flows to the Todd Lane Undercrossing.

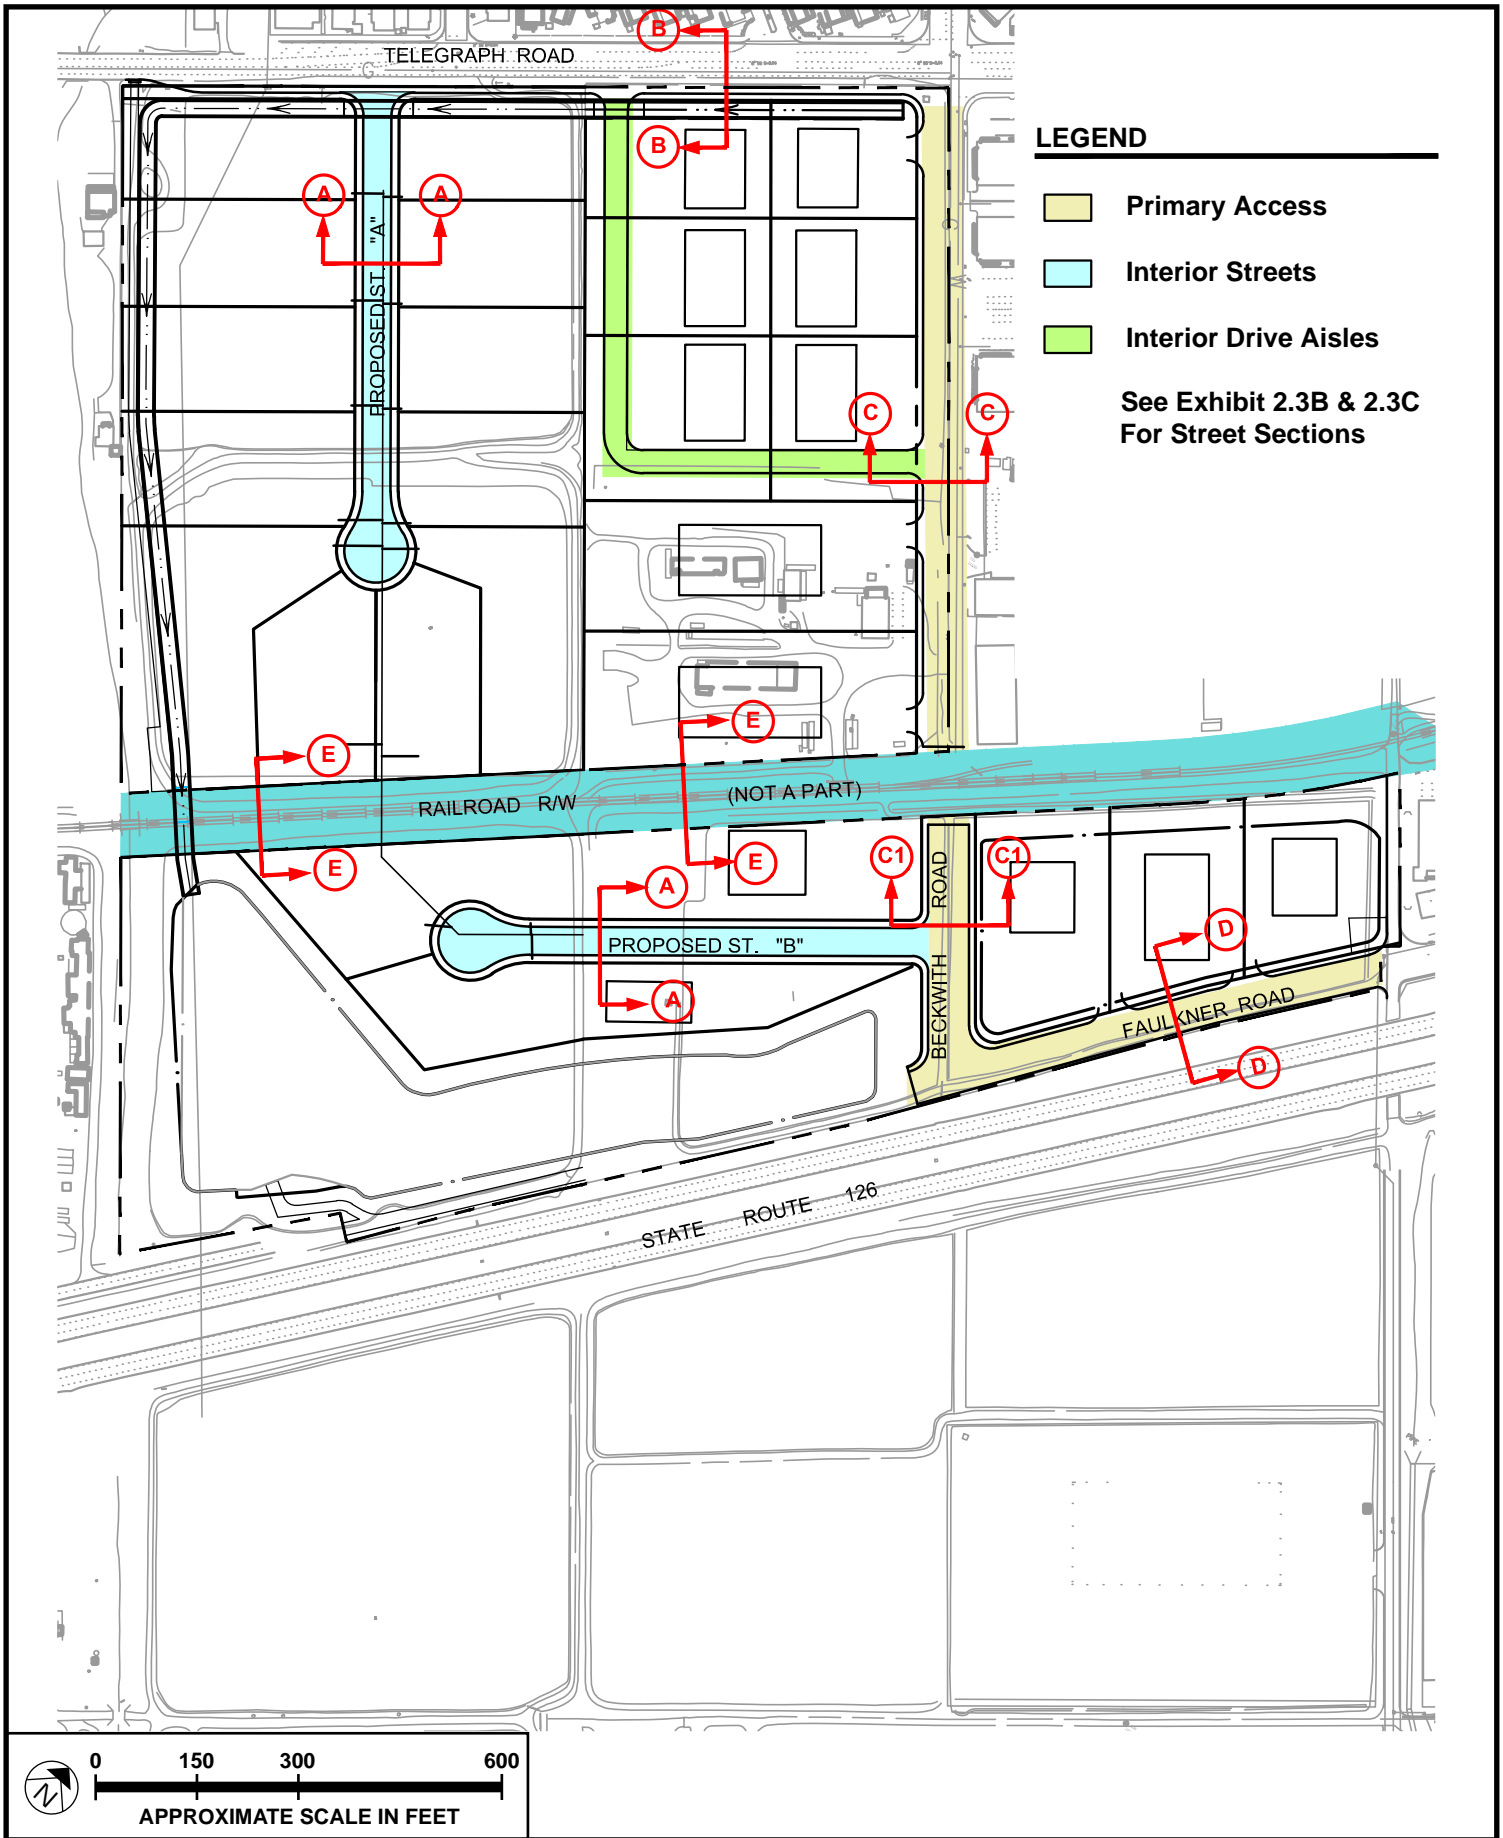

The storm drain system within the Specific Plan Area will collect on-site runoff and direct most of it to the large on-site privately maintained detention basin. This detention basin will significantly reduce peak runoff volumes downstream by storing the peak event flows and lagging their release after the storm peak. This basin will have a low level 36" RCP outlet pipe with a flap gate which will drain to Adams Barranca upstream of, or into, the double RCB Caltrans culvert below the freeway.

Site Access and Circulation

The Specific Plan includes a Circulation Master Plan that provides a framework and standards for road development to ensure a safe and adequate system of vehicular, pedestrian, and bicycle circulation. The vehicular circulation system consists of public roadway access from Telegraph Road, Beckwith Road, and Faulkner Road that would provide direct access to the Project Site driveways. Telegraph Road fronts the property to the north and is the principal arterial that would serve the Project. Primary north/south access to the Project Site north of the railroad right-of-way is Beckwith Road from Telegraph Road and east/west access is from Faulkner Road. Accommodating the larger detention basin in the southern portion of the Specific Plan Area requires minor changes to the configuration of the planned streets in this portion of the Project Site. The proposed **Vehicular Circulation Plan** is shown in **Figure 2.0-7**.

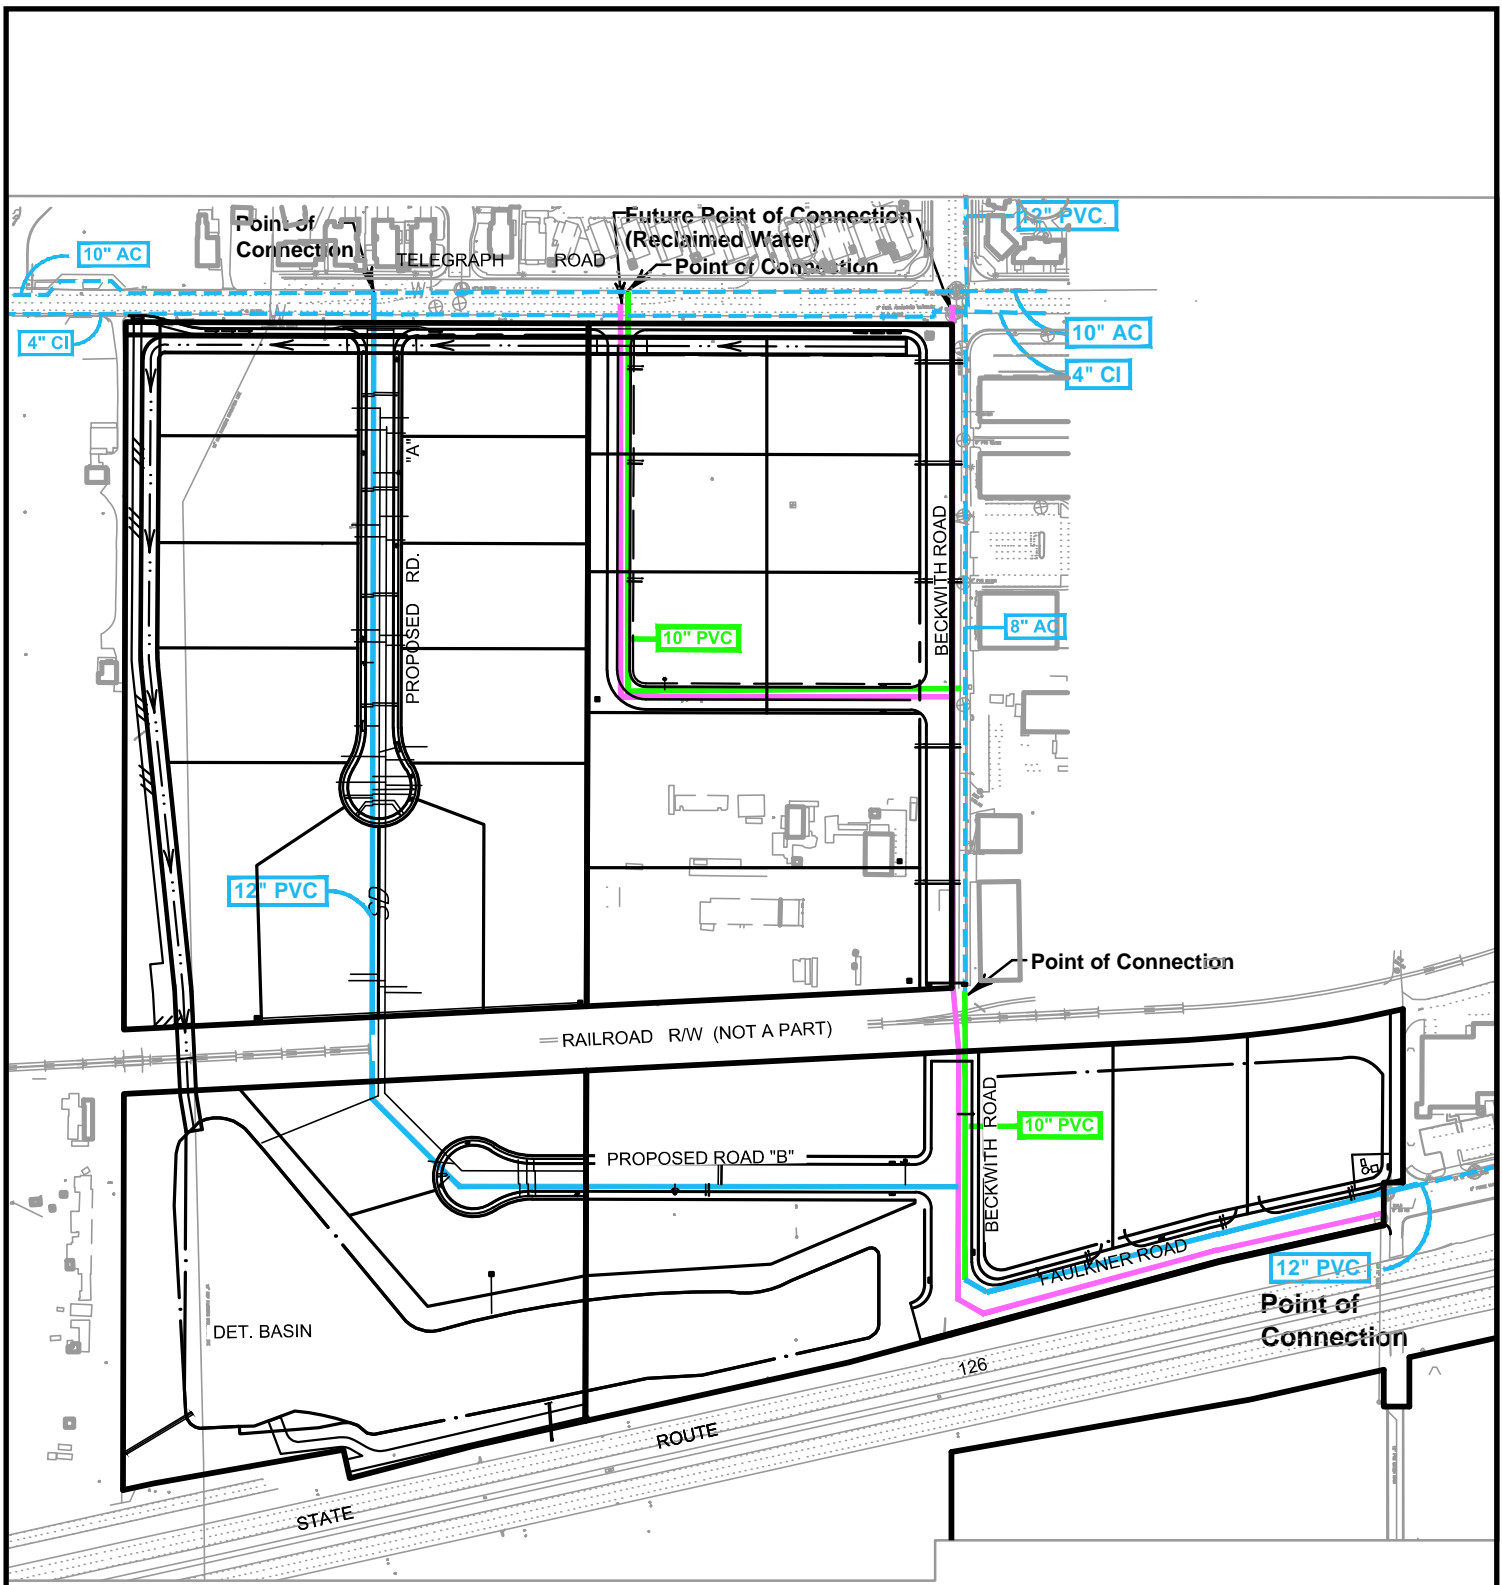

Utilities

The Specific Plan includes an infrastructure plan establishing the network of on- and off-site infrastructure construction requirements to support development of the Specific Plan. These include infrastructure to support potable water delivery, wastewater pipelines, a storm drain system, electricity and natural gas, and other facilities. Minor reconfiguration of these planned utilities is proposed to reflect the changes to the drainage and circulation master plans. The proposed utility plans are shown in **Figure 2.0-8: Domestic and Recycled Water Master Plan** and **Figure 2.0-9: Sewer System Master Plan**.

2.2.3 Project Approvals and Permits

The proposed Specific Plan Amendment will require review and approval by the City of Santa Paula. Subsequent to approval of the Specific Plan Amendment, the City will consider a revised Master Vesting Tentative Map. In February 2013, the City filed an application with the Ventura LAFCO to reorganize (annex) the Project Site to the City of Santa Paula. Review of this application is pending. In addition, the California Department of Transportation will need to approve an encroachment permit for construction within the State right of way for SR-126.

3.0 ENVIRONMENTAL ANALYSIS

This section includes separate subsections for each environmental topic addressed in the Santa Paula West Business Park Specific Plan Final EIR. Each topical section includes a summary of the information and conclusions of the analysis in the Final EIR. Updated information reflecting any changes in the environmental setting related to each topic is presented first in each subsection, followed by analysis of the environmental impacts of the proposed Project. For each topic, a determination is also made whether the proposed Project would result in any new significant impacts or any substantial increase in the severity of the impacts identified in the Final EIR.

3.1 Aesthetics

Summary of Analysis in the Final EIR

The Final EIR analyzed changes to the visual character of the Project Site and the surrounding area that would result from the commercial and light industrial development that would be allowed by the SPW Business Park Specific Plan. Scenic resources in the area include agricultural land; Adams Barranca on the west boundary of the Project Site; open space in foreground and middle-ground views available from SR 126; and background views of foothills and slopes rising to Santa Paula Ridge to the north from SR 126, Telegraph Road and other public streets in the area.

The existing visual character of the Project Site as viewed from SR 126, Telegraph Road, Beckwith Road, Todd Lane, and Faulkner Road, is predominantly agricultural in nature, with ancillary agricultural facilities, row crops, and orchards.

Development in accordance with the Specific Plan would result in extending the existing urbanized visual character of the City of Santa Paula westward onto the Project Site, and views from SR 126 and streets in the area would be affected. The SPW Specific Plan includes a landscape master plan and a feature of this plan is landscaping along Adams Barranca on the western edge of the Project Site to provide a buffer with the agricultural land located west of the Project Site.

More distant scenic vistas views of the Santa Clara River Valley would not be substantially affected by development of the Project Site. There are no existing structures on the Project Site that have historical significance, nor does the Project Site contain visually important trees or geologic features. Further, the Project would incorporate various open space/passive uses into the Project design to preserve the visual quality of Adams Barranca. However, the change in views from the public viewpoints near the Project was identified as a significant and unavoidable impact of the Project.

Additionally, the Project would result in a potential for an increase from glare from any reflective surfaces that may be associated with buildings on the site, and an increase in artificial light during the night, given that minimal outdoor lighting is currently emitted from the Project Site. **Mitigation Measure AES-1** was identified in the Final EIR to mitigate the impact of light and glare from the West Business Park Project by requiring submission and approval of a Lighting Plan for the site.

Analysis of Proposed Specific Plan Amendment

The primary change associated with the proposed Specific Plan Amendment is an increase in the size of the flood control basin planned in the southwest portion of the 54-acre Project Site by approximately 6 acres. This basin would extend from Adams Barranca east to Beckwith Road and would provide a visual buffer from SR-126 to development on the site. With the increased basin, development would only occur adjacent to SR 126 from Beckwith Road to the eastern edge of the Project Site. The overall visual character of the Project Site would still change from agricultural to urban.

No new potentially significant impacts would occur as a result of the proposed Specific Plan Amendment, and the additional information provided in this addendum does not identify any substantial increase in the severity of significant impacts previously identified in the Final EIR.

3.2 Agricultural Resources

Summary of Analysis in the Final EIR

The Final EIR identified that implementation of the SPW Business Park Specific Plan would result in the conversion of approximately 44.20 acres of Prime Farmland and 4.88 acres of Farmland of Statewide Importance.

Existing agricultural lands producing avocados, citrus fruits, and a variety of row crops are located south of the Specific Plan area, south of State Route (SR) 126, and near the western boundary of the SPW Business Park Specific Plan, west of Adams Barranca. Agricultural operations to the south are separated from the Project Site by SR 126.

The Final EIR included **Mitigation Measure A-1** to minimize impacts to Prime Farmland and Important Farmland. This measure requires the Applicant to provide payment for a conservation easement on officially designated Prime or Important Farmland, or contribute to a local, regional, or Statewide organization whose purpose is to acquire agricultural conservation easements for Prime and Important Farmland. The Final EIR concluded that even with implementation of this mitigation measure, the Project would result in significant and unavoidable impacts related to agricultural resources due to the conversion of land identified as Prime and Farmland of Statewide Importance to non-agricultural uses.

Analysis of Proposed Specific Plan Amendment

The proposed amendment would reduce the amount of the Project Site developed with commercial and light industrial uses to accommodate a larger flood control basin. The entire Project Site would, however, continue to be developed. For this reason, impacts on agricultural land would not change. **Mitigation Measure A-1** in the SPWBSP EIR would require payment to contribute to a conservation easement that would support a local, regional, or Statewide organization whose purpose is to acquire agricultural conservation easements for Prime and Important Farmland.

No new potentially significant impacts would occur as a result of the proposed Specific Plan Amendment, and the additional information provided in this addendum does not identify any substantial increase in the severity of any impacts previously identified in the Santa Paula West Business Park Specific Plan Final EIR.

3.3 Air Quality

Summary of Analysis in the Final EIR

The Final EIR included analysis of the consistency of the Project with the 2007 Air Quality Management Plan (AQMP), which was based on residential population growth projections within the various growth and non-growth areas of the County. As the SPW Business Park Specific Plan was proposed to implement the Santa Paula General Plan, the growth associated with the SPW Business Park Specific Plan was determined to not conflict with the 2007 AQMP. For this reason, the Final EIR determined the SPW Business Park Specific Plan would not jeopardize attainment of State and national ambient air quality standards in Ventura County.

The Final EIR estimated emissions from construction activities that would occur with the SPW Business Park Specific Plan and determined these emissions would exceed Ventura County Air Pollution Control District (VCAPCD) thresholds for ROG and NO_x throughout the entire construction period. Additionally, the Final EIR assessed the potential for increases in air emissions from subsequent development in the SPW Business Park Specific Plan Area after annexation. **Table 3.3-1: Estimated Operational Emissions – SPW Business Park Specific Plan Area** shows the emissions estimated from development in the SPW Business Park Specific Plan Area. As shown, the estimated daily operational emissions of ROG were above the thresholds of significance recommended by VCAPCD.

Source	Pollutant (pounds/day)					
	ROG	NO _x	CO	SO _x	PM ₁₀	PM _{2.5}
Maximum	29.71	22.93	103.64	0.41	29.44	8.33
<i>VCAPCD Thresholds</i>	<i>25.00</i>	<i>25.00</i>	<i>NT</i>	<i>NT</i>	<i>NT</i>	<i>NT</i>
Threshold exceeded?	Yes	No	No	No	No	No

Source: Meridian Consultants, 2013. Calculation data are provided in Santa Paula West Business Park Specific Plan DEIR.

Note:

*CO = carbon monoxide; NO_x = nitrogen oxide; PM10 = particulate matter less than 10 microns; PM2.5 = particulate matter less than 2.5 microns; ROG = reactive organic gas; SO_x = sulfur oxide.
NT = no threshold of significance.*

Mitigation measures recommended by VCAPCD to reduce emissions associated with the proposed development were included as features of the SPW Business Park Specific Plan Project. These measures included contribution to an off-site transportation demand management (TDM) fund and during clearing,

grading, earthmoving, or excavation operations, excessive fugitive dust emissions shall be controlled by regular watering or other dust-preventative measures using the following procedures, as specified by the VCAPCD and Rule 51.

Mitigation Measures AQ-1, AQ-2, AQ-3, AQ-4, and AQ-5 reduced impacts to construction air quality emissions to less than significant by reducing fugitive dust emissions and pollutants caused by construction equipment, periodic inspections of construction equipment vehicles, compliance with California Vehicle Code Section 23114 with special attention to subsections 2311(b)(F), (e)(2) and (e)(4), and adherence to VCAPCD Rule 74.2 (Architectural Coatings). Mitigation Measures AQ-6, AQ-7, and AQ-8 would reduce impacts during operation of the SPW Business Park Specific Plan Project by including low emission water heaters for commercial water heating, construct pedestrian and transit friendly facilities, and provide shuttle/minibus service to the site. Mitigation Measures AQ-9, AQ-10, and AQ-11 mitigate effects of releasing spores during construction by hiring construction employees, to the extent feasible, from local populations who may have previously been exposed and therefore immune, requiring respirators during periods of high dust, and the operator cab of area grading and construction equipment must be enclosed and air-conditioned. Mitigation Measures AQ-12 and AQ-11 require the Applicant to plant and maintain shade trees to reduce heat build-up on structures and require the preparation of a Transportation Demand Management plan (TDM) for review and approval by the City and VCAPCD.

Analysis of Proposed Specific Plan Amendment

The proposed Specific Plan Amendment Project would reduce the amount of land available for development within the 54-acre Specific Plan Area as the flood control basin would be 6 acres larger. The changes to the conceptual grading plan to accommodate the revised drainage and flood control plan would reduce the amount of soil imported and increase the overall volume of grading. Table 3.3-2: Maximum Construction Emissions, below, provides updated modeling of construction emissions using the latest version of CalEEMod, the Statewide land use emissions computer model designed to provide a uniform platform to quantify potential criteria pollutant emissions associated with both construction and operations from a variety of land use projects.

TABLE 3.3-2 MAXIMUM CONSTRUCTION EMISSIONS

Year 2024	3.9	56.9	36.5	0.2	8.4	4.4
Year 2025	3.6	51.2	34.8	0.2	8.2	3.5
Year 2026	40.1	16.8	33.3	<0.1	6.2	1.8
Year 2027	40.1	8.2	15.3	<0.1	1.4	0.6
Maximum Emissions	40.1	56.9	36.5	0.2	8.4	4.4
SPW Business Park Final EIR Maximum Construction Emissions for Approved Project	235.2	158.7	118.4	0.6	35.1	13.1

As shown in Table 3.3-2, with the revised project, maximum emissions during construction would be reduced in comparison to the approved Project.

The amount of development within the Specific Plan Area would be less with the proposed amendment as the amount of the Specific Plan Area available for development would be reduced to accommodate the larger flood control basin. The amount of traffic generated by the Project would also be reduced. For these reasons, operational air quality emissions would also be reduced in comparison to the approved Project.

Mitigation Measures AQ-1 through AQ-12, as identified in the Final EIR and adopted by the City, would apply to the revised project and would reduce air quality impacts during construction and operation of the proposed Project to the maximum extent feasible.

No new significant impacts would result from the proposed Specific Plan Amendment and the additional information provided in this addendum does not identify any substantial increase in the severity of impacts previously identified in the Santa Paula West Business Park Specific Plan Final EIR.

3.4 Biological Resources

Summary of Analysis in the Final EIR

The Final EIR determined that no special-status plant species are expected to occur within the avocado orchards agricultural ditch, agricultural row crop communities, or disturbed areas on the Project Site. The Specific Plan designates the riparian habitat on the Project Site associated with Adams Barranca as Open Space. Mitigation Measure BR-1 was identified to reduce impacts to the native riparian habitat adjacent to the Project Site by requiring the locations of any protected trees to be identified on grading plans and provide a tree report identifying measures to preserve any tree(s) that could be affected by grading. Additionally, Mitigation Measures BR-2, BR-3, and BR-4 require landscaping and irrigation plans that incorporate native vegetation and water conservation, as well as nesting bird surveys to mitigate impacts to the surrounding habitat.

Adams Barranca, located adjacent to the site, provides marginal habitat for a variety of wildlife species. Mitigation Measures BR-5 and BR-6 require the Applicant to retain a qualified biologist to survey the Project Site for the presence of the American badger and to conduct roosting bat surveys within the Specific Plan area prior to site preparation activities.

Surveys identified approximately 0.117 acres and 1,116 linear feet of agricultural ditch that may represent an ephemeral drainage under the jurisdiction of the ACOE. Alteration of State-protected waters and associated riparian vegetation would require the acquisition of a Fish and Game Code Section 1602 SAA from the CDFW. Mitigation Measures BR-7 and BR-8 require a Streambed Alteration Agreement (SAA) and a Nationwide Permit (NWP) to be obtained, and mitigation measures recommended by the ACOE, CDFW, and the National Marine Fisheries shall be implemented. Further, Mitigation Measures BR-9 and BR-10 define additional mitigation measures to meet Regional Board and CDFW applicable standards.

Analysis of Proposed Specific Plan Amendment

The proposed amendment would enlarge the flood control basin in the southwest corner of the Project Site and reduce the amount of the Project Site available for commercial and light industrial development. Overall, the amount of the Project Site designated as open space would increase to account for the enlarged flood control basin. **Mitigation Measures BR-1 through BR-10**, as identified in the Final EIR and adopted for the Project, would continue to be applicable. No changes to these mitigation measures are proposed or needed.

No new potentially significant impacts would occur as a result of the proposed Specific Plan Amendment and the additional information provided in this addendum does not identify any substantial increase in the severity of any impacts previously identified in the Santa Paula West Business Park Specific Plan Final EIR.

3.5 Cultural Resources

Summary of Analysis in the Final EIR

The majority of the soil on the Project Site consists of younger alluvial soils, which have a low potential of containing significant paleontological resources. Because these depths of older alluvial soils are unknown, there is a moderate to high potential for earthmoving activities during construction to encounter fossils within the older alluvium on the Project Site. **Mitigation Measure CUL-1** mitigates this impact by requiring a qualified paleontologist to assess unexpected paleontological resources discovered during any ground-disturbance activities.

Ground-disturbing activities could potentially uncover previously unknown resources, including human remains. In the event that human remains are uncovered during subsurface excavation activities, implementation of **Mitigation Measure CUL-2** requires a qualified archaeologist to determine whether any bones encountered are human and to supervise appropriate treatment of any resources encountered.

A majority of the Project Site has been farmed with various row crops and orchards, which has continually disturbed the surface of the soils. While the Project Site does not contain any known sensitive archaeological resources within the disturbance area, the Santa Clara River Valley is considered sensitive, and there is potential for unknown resources to be uncovered by activities, such as grading, that disturb the ground surface. **Mitigation Measure CUL-3** would mitigate potential impacts to less than significant by requiring an independent qualified archaeologist to assess any archaeological resources discovered during construction.

Analysis of Proposed Specific Plan Amendment

With the amendment, the Project would include a 7.4-acre, 8-foot-deep on-site flood storage basin, in addition to the approved development, as part of the Specific Plan. As discussed in the Santa Paula West Business Park Specific Plan Final EIR, the soil on the Project Site is considered to have a low potential to contain significant paleontological resources. However, ground-disturbing activities could potentially

uncover previously unknown resources, including human remains. **Mitigation Measures CUL-1, CUL-2, and CUL-3** in the Santa Paula West Business Park Specific Plan Final EIR would reduce potential impacts to paleontological and archaeological resources, and human remains, by requiring a qualified archaeologist to assess the resource or human remains.

No new potentially significant impacts would occur as a result of the proposed Specific Plan Amendment, and the additional information provided in this addendum does not identify any substantial increase in the severity of any impacts previously identified in the Santa Paula West Business Park Specific Plan Final EIR.

3.6 Geology and Soils

Summary of Analysis in the Final EIR

The Final EIR evaluated potential impacts related to geology and soil conditions in the Specific Plan area. The Project Site is not located within a designated Alquist-Priolo Earthquake Fault Zone (APEFZ) or crossed by a known active fault. As such, the risk of loss, injury, or death associated with surface rupture of a known earthquake fault was identified as very low.

Most of the Project Site lies within a liquefaction hazard zone, an area where the historic occurrence of liquefaction or groundwater conditions indicate a potential for ground displacements as a result of liquefaction, as designated by the State of California and the City of Santa Paula. **Mitigation Measure G-1** would require additional explorations be performed to establish required removal depths and delineate any portion of the Project Site deemed susceptible to seismically induced settlement.

The native topsoil and alluvial soils within the Project Site may be moderately susceptible to erosion. Native topsoil and alluvial soils will be particularly prone to erosion during construction or earth moving activities, especially during heavy rains. The impact of erosion at the Project Site is considered to be potentially significant.

The alluvial soils present in the Project Site generally have a low expansion potential. However, soils with a higher expansion potential (medium or greater) are known to be present in the local area. Expansive soils could pose a risk to improvements planned for the area. The Project Site is not located within a Landslide Zone, but it does lie within a Liquefaction Zone. Liquefaction zones identify where the stability of foundation soils must be investigated and countermeasures undertaken in the design and construction of buildings for human occupancy. Statutes require that cities and counties use these zones as part of their construction permitting process, which the City of Santa Paula addresses through the building regulations contained in the Municipal Code. **Mitigation Measures G-2 and G-3** were identified in the Final EIR to reduce potential impacts to erosion and expansive soils to less than significant by requiring detailed, design-level geotechnical investigation reports for all future development within the Specific Plan Area, as well as require a final grading and erosion control plan to be approved prior to any construction to minimize erosion.

The Specific Plan area could be subject to strong ground shaking in the event of an earthquake originating along one of the faults within the area. All structures will be designed in accordance with the then-current CBC and applicable City codes to ensure safety in the event of an earthquake. Additionally, **Mitigation Measure G-1** requires additional explorations within the Project Site to determine any areas that might be susceptible to seismically induced settlement and identify design standards to address any settlement that may occur.

Further, the Project Site does not lie in a tsunami or seiche zone and, thus, would not create any impacts related to tsunami or seiche risk.

Analysis of Proposed Specific Plan Amendment

The proposed amendment would modify the drainage and flood control plan to allow for storage of floodwater within the Specific Plan Area. No other changes are proposed to the approved Specific Plan.

The adopted mitigation measures to address geology and soil conditions would continue to apply and no new potentially significant impacts would occur as a result of the proposed Project. The additional information provided in this addendum does not identify any substantial increase in the severity of any impacts previously identified in the Santa Paula West Business Park Specific Plan Final EIR.

3.7 Greenhouse Gases

Summary of Analysis in the Final EIR

The Specific Plan would result in short-term GHG emissions during construction. Construction activities associated with the Project would generate approximately 2,388 MTCO₂e of GHG emissions. Construction-related GHG emissions were annualized over the entire construction period and included in the annual operational emissions. As the VCAPCD had not approved GHG emission thresholds, thresholds developed by the South Coast Air Quality Management District were used in the analysis. All industrial land use projects that exceed 10,000 MTCO₂e per year would be considered potentially significant under the screening threshold developed by the SCAQMD. The estimated Project operational GHG emissions with project design features would be approximately 6,675 MTCO₂e per year, which would not exceed this screening threshold.

The SPW Business Park Project was determined to be consistent with applicable strategies of the 2008 CARB Climate Change Scoping Plan and the and the 2014 Updated Scoping Plan to reduce greenhouse gas emissions in California. GHG emission impacts were determined to be less than significant.

Analysis of Proposed Specific Plan Amendment

In efforts to reduce and mitigate climate change impacts, State and local governments have been implementing policies and initiatives aimed at reducing GHG emissions. California, one of the largest state contributors to the national GHG emission inventory, has adopted significant reduction targets and strategies. The State Legislature passed Senate Bill (SB) 32, which set a 2030 GHG emissions reduction

target of 40 percent below 1990 levels.¹ AB 32 requires the California Air Resources Board (CARB) to develop a Scoping Plan which lays out California's strategy for meeting the goals. The Scoping Plan must be updated every five years. The 2022 Scoping Plan is the most recent update that lays out a path to achieve targets for carbon neutrality and reduce anthropogenic GHG emissions by 85 percent below 1990 levels no later than 2045, as directed by Assembly Bill 1279.² The actions and outcomes in the plan will achieve: significant reductions in fossil fuel combustion by deploying clean technologies and fuels, further reductions in short-lived climate pollutants, support for sustainable development, increased action on natural and working lands to reduce emissions and sequester carbon, and the capture and storage of carbon. To meet the Statewide reduction targets, projects must contribute to slowing the increase in GHG emissions and should contribute to reducing the State's GHG output. In order to reach California's GHG reduction targets, per capita emissions would need to be reduced by approximately five percent each year from 2022 to 2030, with continued reductions through 2050.

The SPW Business Park Project would comply with the most recent CalGreen Code and Building Efficiency Standards per the California Energy Commission. Moreover, Statewide efforts like Executive Order B-55-18 (carbon neutrality) and CARB's Advanced Clean Fleets would further reduce greenhouse gas emissions during the lifetime of the proposed Project. As such, the proposed Project would not conflict with applicable strategies to reduce greenhouse gas emissions. As the amount of land available for development would be reduced with the proposed Specific Plan Amendment, the amount of development and GHG emissions associated with this development would be reduced in comparison to the approved project.

No new potentially significant GHG impacts would occur as a result of the proposed amendment, and the additional information provided in this addendum does not identify any substantial increase in the impacts previously identified in the Santa Paula West Business Park Specific Plan Final EIR.

3.8 Hazards and Hazardous Materials

Summary of Analysis in the Final EIR

The Final EIR identified that, based on the age of the on-site structures built prior to 1970, there is potential for the exposure of ACMs, PCBs, or LBPs at the SPWBSP Project Site. **Mitigation Measures HM-1, HM-2, HM-3, and HM-4** were identified to mitigate the effects of these hazardous materials on-site during construction and operation. These mitigation measures require the Applicant to submit verification to the City of Santa Paula Building and Safety Department that an asbestos survey has been conducted on any buildings and irrigation pipelines that are to be demolished or removed; a lead based paint survey has been conducted; all fluorescent light fixtures within the existing buildings shall be

2 California Air Resources Board (CARB). *Final 2022 Scoping Plan Update*. <https://ww2.arb.ca.gov/our-work/programs/ab-32-climate-change-scoping-plan/2022-scoping-plan-documents>. Accessed January 2023.

inspected for PCB; and pole-mounted transformers, light ballasts, or other equipment suspected to contain PCBs must be inspected for the presence of PCBs prior to before any disturbance or removal.

The Santa Paula West Business Park Specific Plan Area also has a history of being used for agricultural purposes, which typically included the use of organochlorine pesticides such as DDD, DDE, and DDT prior to use of these pesticides being prohibited. The Final EIR noted that the limited Phase II ESA that was conducted for the Project Site determined that exposure of residual pesticides is considered low. However, soil testing may not always indicate every condition within the Project, and clearing of existing debris or soils could uncover hazardous material contamination not previously known to occur on-site. **Mitigation Measure HM-5** was identified to reduce potentially significant impacts from the release of hazardous materials in the environment to less than significant by requiring implementation of investigation/remediation in the event that previously unknown soil and/or groundwater contamination is discovered during construction.

Analysis of Proposed Specific Plan Amendment

The proposed amendment would enlarge the flood control basin in the southwest corner of the Project Site and reduce the amount of the Project Site available for commercial and light industrial development. As discussed in the SPWBSP EIR, there is the potential for the Project Site to contain soil or debris that has been contaminated by chemicals from previous agricultural activities. Additionally, the few buildings on-site were built prior to 1970 and there is potential for the exposure of ACMs, PCBs, or LBPs. **Mitigation Measures HM-1, HM-2, HM-3, HM-4, and HM-5** in the SPWBSP EIR would be implemented to mitigate potential impacts from any hazardous materials that may be present in the existing buildings to be demolished and the potential for soil contamination.

No new potentially significant impacts would occur as a result of the proposed amendment and the additional information provided in this addendum does not identify any substantial increase in the severity of any impacts previously identified in the Santa Paula West Business Park Specific Plan Final EIR.

3.9 Hydrology and Water Resources

Summary of Analysis in the Final EIR

All future development within the SPW Business Park Specific Plan Area would be subject to the State Water Resource Control Board (SWRCB) and United States Environmental Protection Agency (USEPA) permits, as well as Stormwater Pollution Prevention Plan (SWPPP) requirements. To reduce the discharge of pollutants during construction of the proposed development, a site-specific SWPPP would be developed in accordance with the NPDES Program General permit, authorized under the Clean Water Act for Construction Activities.

The approved Specific Plan identified bioswales in parking landscape areas to treat stormwater runoff prior to discharge into Adams Barranca and the Santa Clara River. Biofilter inserts will be installed in

curb inlets to capture oil and grease, suspended solids, metals, gasoline, pesticides, and pathogens. In addition, storm drain inlets and catch basins will have signage and stenciling to discourage illegal dumping. Filters and signage would be checked and/or replaced annually. With these project features, the Project would not result in significant impacts to water quality.

The conceptual drainage plan in the approved Specific Plan included an interceptor channel along Telegraph Road along the northern edge of the Project Site, with another interceptor channel parallel to Adams Barranca from Telegraph Road to Freeway 126, with a discharge point back into Adams Barranca upstream of the SR 126 Freeway. The channel designed along the western edge of the Project Site was designed to have the capacity to handle flows that overtop the eastern bank of Adams Barranca and the water that ponds on the Project Site due to the undersized culvert at SR 126.

The planned storm drain system would collect on-site runoff and direct it to two surface detention basins planned on the western edge of the Project Site along Adams Barranca, north of the railroad and north of the SR 126 Freeway. These detention basins were sized to treat 8% of the Q 50 (50 year storm event) runoff from the storm drain system consistent with the Ventura County Storm Water Quality Urban Impact Mitigation Plan (SQUIMP) guidelines and would reduce flow rates, allow sediment to settle, and allow for infiltration of runoff. The Final EIR concluded that the Project would not have an adverse effect on drainage and flood conditions on the Project Site or surrounding properties.

The Final EIR also determined the Project would not result in a significant new demand for water and will not substantially deplete groundwater supplies. In addition, the Specific Plan incorporates design features such as bioswales, bioretention cells, infiltration trenches, and permeable pavement, along with detention basins to allow surface water runoff percolation. Therefore, the Specific Plan would not substantially interfere with groundwater recharge. There will be no substantial impact to local groundwater recharge.

Analysis of Proposed Specific Plan Amendment

Based on consultation with the Ventura County Watershed Protection District (VCWPD), the drainage and flood control plan included in the approved Specific Plan was redesigned to ensure the Project Site would not be flooded or have any adverse effects on adjacent properties or the SR-126 Freeway, and would replace the existing natural floodplain storage on the Project Site. The proposed Specific Plan Amendment includes modifications to the drainage and flood control plan to increase the volume of floodwater from Adams Barranca that can be accommodated within the Specific Plan Area. The Flood Control Conceptual Design Report in **Appendix A** contains the hydrology modeling completed to define the revised design.³

3 Kasraie Consulting. *Flood Protection Conceptual Design* (Revised June 2022) *Santa Paula West Business Park Specific Plan EIR* (RMA 14-019-1). June 30, 2022. See **Appendix A**.

Instead of discharging the flows back into Adams Barranca above the freeway, the revised drainage plan in the proposed Specific Plan Amendment directs these overflows into a larger on-site storage basin located where the 100-year flood is expected to flow over the SR 126 freeway under the existing condition. This 7.4-acre, 8-foot deep basin would act as an “inlet bay” where most of the on-site flood waters would be collected via the north and the west interceptor channels. The basin would provide a spillage area where flood flows would overtop the freeway similarly to the existing condition, and it would be utilized to also serve as an on-site detention and stormwater quality treatment basin mitigation resulting in making more of the Project Site available for development. The proposed interceptor channels and storage basin would provide an additional 28.5 acre-ft (53% more) of floodplain storage when compared to the existing condition. This flood storage basin will have a low level 36” RCP outlet pipe with a flap gate which will drain to Adams Barranca upstream of, or into, the double RCB Caltrans culvert below the SR 126 freeway.

Soils and geotechnical studies will be completed at the time design plans are prepared to address soil slope and stability along the freeway under the proposed condition, and to determine appropriate erosion or settlement protection measures. Therefore, impacts related to flooding at the Project Site would be less than significant.

The flows entering Beckwith Road from Telegraph Road to the railroad tracks will also be intercepted and collected at the Telegraph Road intersection via a series of catch basin inlets and storm drains, so as to minimize the flows discharging south on Beckwith Road and overtopping the railroad tracks.

Along the east end of the Project Site to the Beckwith Road extension, an earthen interceptor channel, between the proposed building pad and existing railroad, will collect flows overflowing the tracks and will convey them to the Todd Lane Undercrossing.

The revised drainage and flood control plan meets the design criteria defined by the City in consultation with the VCWPD including that drainage flows at the current point of discharge from the Project Site at the SR 126 Freeway and at the Todd Lane Undercrossing will be equal or less than existing conditions; that flood conditions in Adams Barranca and adjacent properties will be equal or less than existing conditions; and that the flood control basin have the capacity to accommodate the existing floodplain storage on the Project Site.

As the amount of development would be reduced with the proposed Specific Plan Amendment, the water needed for the Project would be reduced. The Final EIR also determined the Project would not result in a significant new demand for water and will not substantially deplete groundwater supplies. The revised drainage and flood control plan continues to incorporate design features such as bioswales, bioretention cells, infiltration trenches, and permeable pavement, along with the larger detention basin to allow surface water runoff percolation. With these features, the Specific Plan would not substantially interfere with groundwater recharge and there will be no substantial impact to local groundwater recharge.

No new potentially significant impacts would occur as a result of the proposed Specific Plan Amendment, and the additional information provided in this addendum does not identify any substantial increase in the severity of impacts previously identified in the Santa Paula West Business Park Specific Plan Final EIR.

3.10 Land Use

Summary of Analysis in the Final EIR

As proposed, the Santa Paula West Business Park Specific Plan Project involved annexation of approximately 54 acres of unincorporated territory to the City of Santa Paula. The parcels within the Specific Plan boundary would be subdivided with a Tentative Tract Map and roadways within the plan area would be created. The Final EIR concluded the annexation of the Project Site would be consistent with surrounding uses and would not divide any existing communities. Further, the annexation of the Santa Paula West Business Park Specific Plan Project would be in accordance with the City's General Plan to expand the City limits to coincide with the City's adopted Sphere of Influence (SOI) and City Urban Restriction Boundary (CURB).

The consistency of the Santa Paula West Business Park Specific Plan Project with applicable land use plans and policies was analyzed in the Final EIR. This evaluation addressed the consistency of the project with the City's General Plan and Municipal Code, the County of Ventura General Plan and Non-Coastal Zoning Ordinance, the 2016 Southern California Association of Governments (SCAG) Regional Transportation Plan/Sustainable Community Strategy (RTP/SCS), and the Ventura County Local Agency Formation Commission (LAFCo) policies. No significant impacts related to inconsistencies with applicable land use plans and policies were identified in the Final EIR and no mitigation measures were identified in the Final EIR.

Analysis of Proposed Specific Plan Amendment

The proposed amendment would reduce the amount of land available for development as a result of increasing the size of the flood control basin to accommodate overflows from Adams Barranca. The allowed land uses within the Santa Paula West Business Park Specific Plan Area would remain consistent with the existing General Plan land use designation and zoning with approval of the proposed Project. No new streets, utility lines, or other major infrastructure is proposed that would involve any substantial physical alterations to the existing community structure that would physically divide the City, within or out of the Project boundaries.

No new potentially significant impacts would occur as a result of the proposed amendment, and the additional information provided in this addendum does not identify any substantial increase in the severity of any impacts previously identified in the Santa Paula West Business Park Specific Plan Final EIR.

3.11 Noise

Summary of Analysis in the Final EIR

Construction noise levels at noise sensitive uses located near the Project Site receptors vary based on the location of construction activity and the amount of equipment in operation. While construction is temporary, the use of this equipment would generate both steady-state and episodic noise that will be heard from within the Project Site and at off-site locations in the surrounding areas. **Mitigation Measures N-1, N-2, N-3, and N-4** would mitigate impacts to sensitive receptors by requiring stationary construction equipment to be placed as far from noise sensitive uses as feasible during all phases of project construction; all construction equipment shall be equipped with appropriate mufflers in good working condition; submittal of a material haul route plan to the City of Santa Paula and the County of Ventura for review and approval; and during all site preparation, grading and construction, the construction contractor shall locate all stockpiling and vehicle staging areas away from existing residences, to the extent feasible.

The Final EIR identified that traffic growth from future development of the Santa Paula West Business Park Specific Plan would not result in significant noise increases, as shown in **Table 3.11-1: Roadway Noise Level 75 feet from Center**, in the Final EIR.

Additionally, while there is currently limited use of the Santa Paula Branch Rail line that passes through the Specific Plan Area, noise from any rail operations would represent an intermittent noise source. Light industrial and commercial uses would be allowed near the southern boundary of the Project Site, north of the Santa Paula Branch of the Southern Pacific Railroad tracks. Due to its proximity to the railroad track, uses allowed within the southern boundary of the Project Site would not be sensitive to the estimated noise level of 69.4 dB(A). Given vibration from the railroad track would not be constant and would be approximately 50 feet from the track, uses allowed within Santa Paula West Specific Plan Area would not be susceptible to ground-borne vibration. Therefore, impacts identified as less than significant.

Analysis of Proposed Specific Plan Amendment

The proposed reconfiguration of the land use plan to accommodate a larger flood control basin would not change the type of commercial and industrial uses allowed within the Specific Plan Area. For this reason, no new potentially significant impacts would occur as a result of the proposed Project, and the additional information provided in this addendum does not identify any substantial increase in the severity of any impacts previously identified in the Santa Paula West Business Park Specific Plan Final EIR.

3.12 Public Services

Public Schools

Summary of Analysis in the Final EIR

The Final EIR determined there was some potential for future employees of businesses in the SPW Business Park Specific Plan Area with school age children to occupy the homes in the City. However, it was expected that the majority of the employees within the Specific Plan would either travel from outside of the City or would reside within the existing and future housing stock in the City. For this reason, it is not anticipated that the Project will generate many new students in the Santa Paula Unified School District (SPUSD). In any event, the Project will pay the school impact fee applicable to commercial and industrial development, which will mitigate any indirect impact on SDUSD school facilities.

Analysis of Proposed Specific Plan Amendment

As the proposed amendment would reduce the amount of commercial and industrial development in the Specific Plan Area, any potential indirect impacts to school facilities would be reduced in comparison to the approved project.

No new potentially significant impacts would occur as a result of the proposed amendment, and the additional information provided in this addendum does not identify any substantial increase in the severity of any impacts previously identified in the Santa Paula West Business Park Specific Plan Final EIR.

Fire Protection

Summary of Analysis in the Final EIR

The EIR discussed that development of the Santa Paula West Business Park would require building plans to be submitted to the Fire Department for review and approval to ensure compliance with UFC. Review of future development plans under the Specific Plan will be required to provide defensible space, serviceable access, adequate fire hydrants, adequate building addressing, adequate interior fire sprinkler systems, adequate fire or emergency alarm system, and approved locking systems for any gated access ways, among other standard conditions.

Future development within the Specific Plan Area would increase the demand for services and resources provided by the fire department over the long term. Adequate levels of fire prevention, suppression, and emergency medical response can be provided to the Specific Plan Area without detriment to the existing community through the resources available at the existing fire stations serving the City. The Final EIR concluded the Project would not require construction of new or expanded fire protection facilities.

Additionally, Mitigation Measures TRA-1, TRA-2, TRA-3, and TRA-4 identified in the Transportation section of the EIR would mitigate traffic congestion by improving the following intersections: Peck Road & Harvard Boulevard/Telegraph Road/Main Street, Peck Road & SR 126 EB On/Off Ramps/Acacia Way,

Beckwith Road & Telegraph Road, and Faulkner Road & SR 126 Westbound On/Off Ramps. With the required plan submittal and approval, and the transportation mitigation measures, impacts to fire protection services would be less than significant.

Analysis of Proposed Specific Plan Amendment

In 2018, the City of Santa Paula was annexed into the Ventura County Fire Department (VCFD) and a Memorandum of Agreement between the City and VCFD was executed describing services and funding.⁴ VCFD also protects the State Responsibility Area (SRA) lands within Santa Paula's Sphere of Influence under an agreement with CAL FIRE. The closest fire station to the Project Site is Station No. 26, located at 536 West Main Street, approximately 0.96 miles northeast of the Project Site.

Construction of the Project may result in accidents, fire, or emergency incidents that would require fire services. However, construction activities would be short-term and limited in scope. After construction, there would be an increase in demand for emergency medical and fire protection services. The VCFD determined that adequate service could be provided by the two existing fire stations in the City and construction of new or expanded fire protection facilities is not required.

No new potentially significant impacts would occur as a result of the proposed Project, and the additional information provided in this addendum does not identify any substantial increase in the impacts previously identified in the Santa Paula West Business Park Specific Plan EIR.

Police Protection

Summary of Analysis in the Final EIR

Development of the Specific Plan would increase the demand for services and resources provided by the Santa Paula Police Department. The Final EIR concluded that the Project would not require construction of new or expanded police protection facilities, project-related police protection impacts would be less than significant.

Analysis of Proposed Specific Plan Amendment

As the amount of new development would be reduced with the proposed Specific Plan Amendment, no new potentially significant impacts would occur, and the additional information provided in this addendum does not identify any substantial increase in the impacts previously identified in the Santa Paula West Business Park Specific Plan EIR.

4 City of Santa Paula. *General Plan 2040*. Page 6-7. <https://www.spcity.org/DocumentCenter/View/1700/Cityof-Santa-Paula-2040-General-Plan---Final-Adopted-2020-03-04>. Accessed January 2023.

Parks and Recreation

Summary of Analysis in the Final EIR

Because the Santa Paula West Business Park Project does not include any new residential zoning or any new residential development projects, the Final EIR concluded the Project would not result in an increase in the residential population that could visit the City's parks and recreation facilities. Project impacts would be less than significant.

Analysis of Proposed Specific Plan Amendment

No new potentially significant impacts would occur as a result of the proposed Project, and the additional information provided in this addendum does not identify any substantial increase in the severity of any impacts previously identified in the Santa Paula West Business Park Specific Plan Final EIR.

3.13 Transportation

Summary of Analysis in the Final EIR

The Final EIR estimated the development allowed by the Specific Plan would generate 5,546 Daily Trips, 646 AM Peak Hour and 732 PM Peak Hour trips. The traffic study addressed the potential for this additional traffic to impact 16 intersections from 10th Street to Briggs Road located north of the SR 126 Freeway. Significant impacts were identified at four intersections: 10th Street and Harvard Boulevard during the AM Peak Hour, Peck Road & Harvard Boulevard/Telegraph Road/Main Street during the AM Peak Hour, Peck Road & SR 126 Eastbound On/Off Ramps/Acacia Way during the PM Peak Hour, and Beckwith Road & Telegraph Road during the PM Peak Hour. Mitigation measures in the Final EIR identified improvements to these intersections that would mitigate all impacts to a less than significant level.

Analysis of Proposed Specific Plan Amendment

The California Environmental Quality Act was amended in July 2020 and it updated the way transportation impacts are measured in California for new development projects, such as to address the amount of vehicle miles traveled (VMT) instead of the level of congestion of roads and intersections.

As the proposed amendment would reduce the amount of development within the SPW Specific Plan Area, the number of trips and VMT generated would be reduced in comparison to the approved Project. For this reason, no new potentially significant impacts would occur as a result of the proposed amendment, and the additional information provided in this addendum does not identify any substantial increase in the impacts previously identified in the Santa Paula West Business Park Specific Plan Final EIR.

3.14 Utilities and Service Systems

Summary of Analysis in the Final EIR

The Final EIR determined that water demand from the Project represented 0.81 percent of City's total projected urban water demand in 2017, and 0.65 percent in 2037. The City's 2010 Urban Water

Management Plan (UWMP) included the projected total water demand for the Santa Paula Business Park through 2035 and demonstrated that supplies are sufficient to meet demands. The projected demand for the Project will account for only a small fraction of the projected demands. Therefore, there would be no impacts to available water supplies and no new or expanded entitlements were determined to be needed.

The Final EIR also concluded that wastewater from the Project would not exceed applicable wastewater quality standards, and the Project impact related to wastewater treatment was less than significant. As concluded in the Sanitary Sewer Technical Report appended to the Final EIR, the Project sewer system will be designed in accordance with applicable City of Santa Paula guidelines. The proposed on-site sewer system would convey most of the wastewater flow to existing sewer lines north of the site along Telegraph Road. The projected wastewater flows are within the City's Wastewater Master Plan estimates for the Specific Plan Area. For these reasons, no significant impacts were identified.

The impact of the Project on solid waste collection and disposal services was also determined to be less than significant, as adequate landfill capacity is available in nearby landfills that serve the City. Solid waste generated during construction and operation of the Project would be required to comply with all federal, State, and local statutes and regulations to reduce and recycle solid waste.

Analysis of Proposed Specific Plan Amendment

As the amount of commercial and light industrial development would be reduced with the proposed amendment, utility demands would be less when compared to the approved project. No new potentially significant impacts would occur as a result of the proposed amendment, and the additional information provided in this addendum does not identify any substantial increase in the severity of impacts previously identified in the Santa Paula West Business Park Specific Plan Final EIR.
